Variable Speed AC drive for induction motors

Part Number: 0478-0352-01  
Issue: 1

## Original Instructions

For the purposes of compliance with the EU Machinery Directive 2006/42/EC:

### General information

The manufacturer accepts no liability for any consequences resulting from inappropriate, negligent or incorrect installation or adjustment of the optional operating parameters of the equipment or from mismatching the variable speed drive with the motor.

The contents of this guide are believed to be correct at the time of printing. In the interests of a commitment to a policy of continuous development and improvement, the manufacturer reserves the right to change the specification of the product or its performance, or the contents of the guide, without notice.

All rights reserved. No part of this guide may be reproduced or transmitted in any form or by any means, electrical or mechanical including photocopying, recording or by an information storage or retrieval system, without permission in writing from the publisher.

### Drive firmware version

This product is supplied with the latest firmware version. If this drive is to be connected to an existing system or machine, all drive firmware versions should be verified to confirm the same functionality as drives of the same model already present. This may also apply to drives returned from an Emerson Industrial Automation Service Centre or Repair Centre. If there is any doubt please contact the supplier of the product.

The firmware version of the drive can be checked by looking at Pr **11.029** and Pr **11.035**.

### Environmental statement

Emerson Industrial Automation is committed to minimising the environmental impacts of its manufacturing operations and of its products throughout their life cycle. To this end, we operate an Environmental Management System (EMS) which is certified to the International Standard ISO 14001. Further information on the EMS, our Environmental Policy and other relevant information is available on request, or can be found at

<http://www.emersonindustrial.com/en-EN/controltechniques/aboutus/environment/Pages/environment.aspx>

The electronic variable-speed drives manufactured by Emerson Industrial Automation have the potential to save energy and (through increased machine/process efficiency) reduce raw material consumption and scrap throughout their long working lifetime. In typical applications, these positive environmental effects far outweigh the negative impacts of product manufacture and end-of-life disposal.

Nevertheless, when the products eventually reach the end of their useful life, they must not be discarded but should instead be recycled by a specialist recycler of electronic equipment. Recyclers will find the products easy to dismantle into their major component parts for efficient recycling. Many parts snap together and can be separated without the use of tools, while other parts are secured with conventional fasteners. Virtually all parts of the product are suitable for recycling.

Product packaging is of good quality and can be re-used. Large products are packed in wooden crates, while smaller products come in strong cardboard cartons which themselves have a high recycled fibre content. If not re-used, these containers can be recycled. Polythene, used on the protective film and bags for wrapping product, can be recycled in the same way. Emerson Industrial Automations' packaging strategy prefers easily-recyclable materials of low environmental impact, and regular reviews identify opportunities for improvement.

When preparing to recycle or dispose of any product or packaging, please observe local legislation and best practice.

### REACH legislation

EC Regulation 1907/2006 on the Registration, Evaluation, Authorisation and restriction of Chemicals (REACH) requires the supplier of an article to inform the recipient if it contains more than a specified proportion of any substance which is considered by the European Chemicals Agency (ECHA) to be a Substance of Very High Concern (SVHC) and is therefore listed by them as a candidate for compulsory authorisation.

For current information on how this requirement applies in relation to specific Emerson Industrial Automations' products, please approach your usual contact in the first instance. Emerson Industrial Automations' position statement can be viewed at:

# How to use this guide

This guide is intended to be used in conjunction with the appropriate Power Installation Guide. The Power Installation Guide gives information necessary to physically install the drive. This guide gives information on drive configuration, operation and optimization.

## NOTE

There are specific safety warnings throughout this guide, located in the relevant sections. In addition, Chapter 1 *Safety information* on page 6 contains general safety information. It is essential that the warnings are observed and the information considered when working with or designing a system using the drive.

This map of the user guide helps to find the right sections for the task you wish to complete, but for specific information, refer to Contents on page 4:

# EU Declaration of Conformity

**Control Techniques Ltd**  
**The Gro**  
**Newtown**  
**Powys**  
**UK**  
**SY16 3BE**

**Moteurs Leroy-Somer**  
**Usine des Agriers**  
**Boulevard Marcellin Leroy**  
**CS10015**  
**16915 Angoulême Cedex 9**  
**France**

This declaration is issued under the sole responsibility of the manufacturer. The object of the declaration is in conformity with the relevant Union harmonization legislation. The declaration applies to the variable speed drive products shown below:

Model number	Interpretation	Nomenclature aaaa - bbc ddddde
aaaa	Basic series	M100, M101, M200, M201, M300, M400, M600, M700, M701, M702, F300, H300, E200, E300, HS30, HS70, HS71, HS72, M000, RECT
bb	Frame size	01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11
c	Voltage rating	1 = 100 V, 2 = 200 V, 4 = 400 V, 5 = 575 V, 6 = 690 V
dddd	Current rating	Example 01000 = 100 A
e	Drive format	A = 6P Rectifier + Inverter (internal choke), D = Inverter, E = 6P Rectifier + Inverter (external choke), T = 12P Rectifier + Inverter (external choke)

The model number may be followed by additional characters that do not affect the ratings.

The variable speed drive products listed above have been designed and manufactured in accordance with the following European harmonized standards:

EN 61800-5-1:2007	Adjustable speed electrical power drive systems - Part 5-1: Safety requirements - Electrical, thermal and energy
EN 61800-3: 2004+A1:2012	Adjustable speed electrical power drive systems - Part 3: EMC requirements and specific test methods
EN 61000-6-2:2005	Electromagnetic compatibility (EMC) - Part 6-2: Generic standards - Immunity for industrial environments
EN 61000-6-4: 2007+ A1:2011	Electromagnetic compatibility (EMC) - Part 6-4: Generic standards - Emission standard for industrial environments
EN 61000-3-2:2014	Electromagnetic compatibility (EMC) - Part 3-2: Limits for harmonic current emissions (equipment input current ≤16 A per phase)
EN 61000-3-3:2013	Electromagnetic compatibility (EMC) - Part 3-3: Limitation of voltage changes, voltage fluctuations and flicker in public, low voltage supply systems, for equipment with rated current ≤16 A per phase and not subject to conditional connection

EN 61000-3-2:2014 Applicable where input current < 16 A. No limits apply for professional equipment where input power ≥1 kW.

These products comply with the Restriction of Hazardous Substances Directive (2011/65/EU), the Low Voltage Directive (2014/35/EU) and the Electromagnetic Compatibility Directive (2014/30/EU).

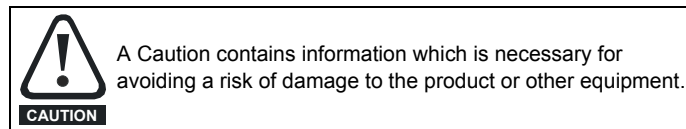

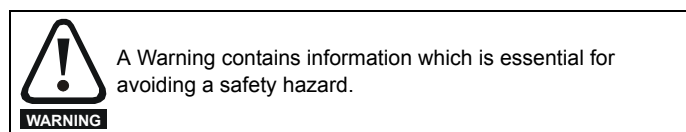

**G Williams**  
**Vice President, Technology**  
**Date: 17th March 2016**

These electronic drive products are intended to be used with appropriate motors, controllers, electrical protection components and other equipment to form complete end products or systems. Compliance with safety and EMC regulations depends upon installing and configuring drives correctly, including using the specified input filters.

The drives must be installed only by professional installers who are familiar with requirements for safety and EMC. Refer to the Product Documentation. An EMC data sheet is available giving detailed information. The assembler is responsible for ensuring that the end product or system complies with all the relevant laws in the country where it is to be used.

# 1 Safety information

## 1.1 Warnings, Cautions and Notes

### NOTE

A Note contains information which helps to ensure correct operation of the product.

## 1.2 Electrical safety - general warning

The voltages used in the drive can cause severe electrical shock and/or burns, and could be lethal. Extreme care is necessary at all times when working with or adjacent to the drive.

Specific warnings are given at the relevant places in this *Control User Guide*.

## 1.3 System design and safety of personnel

The drive is intended as a component for professional incorporation into complete equipment or a system. If installed incorrectly, the drive may present a safety hazard.

The drive uses high voltages and currents, carries a high level of stored electrical energy, and is used to control equipment which can cause injury.

Close attention is required to the electrical installation and the system design to avoid hazards either in normal operation or in the event of equipment malfunction. System design, installation, commissioning/start-up and maintenance must be carried out by personnel who have the necessary training and experience. They must read this safety information and this *Control User Guide* carefully.

The STOP functions of the drive do not isolate dangerous voltages from the output of the drive or from any external option unit. The supply must be disconnected by an approved electrical isolation device before gaining access to the electrical connections.

**None of the drive functions must be used to ensure safety of personnel, i.e. they must not be used for safety-related functions.**

Careful consideration must be given to the functions of the drive which might result in a hazard, either through their intended behavior or through incorrect operation due to a fault. In any application where a malfunction of the drive or its control system could lead to or allow damage, loss or injury, a risk analysis must be carried out, and where necessary, further measures taken to reduce the risk - for example, an over-speed protection device in case of failure of the speed control, or a fail-safe mechanical brake in case of loss of motor braking.

## 1.4 Environmental limits

Instructions in the *Power Installation Guide* regarding transport, storage, installation and use of the drive must be complied with, including the specified environmental limits. Drives must not be subjected to excessive physical force.

## 1.5 Access

Drive access must be restricted to authorized personnel only. Safety regulations which apply at the place of use must be complied with.

## 1.6 Fire protection

The drive enclosure is not classified as a fire enclosure. A separate fire enclosure must be provided. For further information, refer to the relevant *Power Installation Guide*.

## 1.7 Compliance with regulations

The installer is responsible for complying with all relevant regulations, such as national wiring regulations, accident prevention regulations and electromagnetic compatibility (EMC) regulations. Particular attention must be given to the cross-sectional areas of conductors, the selection of fuses or other protection, and protective ground (earth) connections.

The *Power Installation Guide* contains instruction for achieving compliance with specific EMC standards.

Within the European Union, all machinery in which this product is used must comply with the following directives:

2006/42/EC Safety of machinery.

2014/30/EU: Electromagnetic Compatibility Directive.

## 1.8 Motor

Ensure the motor is installed in accordance with the manufacturer's recommendations. Ensure the motor shaft is not exposed.

Standard squirrel cage induction motors are designed for single speed operation. If it is intended to use the capability of the drive to run a motor at speeds above its designed maximum, it is strongly recommended that the manufacturer is consulted first.

Low speeds may cause the motor to overheat because the cooling fan becomes less effective. The motor should be installed with a protection thermistor. If necessary, an electric forced vent fan should be used.

The values of the motor parameters set in the drive affect the protection of the motor. The default values in the drive should not be relied upon.

It is essential that the correct value is entered in Pr **00.006** motor rated current. This affects the thermal protection of the motor.

## 1.9 Adjusting parameters

Some parameters have a profound effect on the operation of the drive. They must not be altered without careful consideration of the impact on the controlled system. Measures must be taken to prevent unwanted changes due to error or tampering.

## 1.10 Electrical installation

### 1.10.1 Electric shock risk

The voltages present in the following locations can cause severe electric shock and may be lethal:

AC supply cables and connections

Output cables and connections

Many internal parts of the drive, and external option units

Unless otherwise indicated, control terminals are single insulated and must not be touched.

### 1.10.2 Stored charge

The drive contains capacitors that remain charged to a potentially lethal voltage after the AC supply has been disconnected. If the drive has been energized, the AC supply must be isolated at least ten minutes before work may continue.

## 1.11 Hazard

### 1.11.1 Falling hazard

The drive presents a falling or toppling hazard. This can cause injury to personnel and therefore should be handled with care.

# 2 Product information

## 2.1 Introduction

### Open loop AC drive

Unidrive M100 and Unidrive M101 deliver maximum machine performance with open loop vector and V/Hz induction motor control, for dynamic and efficient machine operation.

### Features

- Value drive with quality and performance for open loop applications
- NV Media Card for parameter copying and data storage
- 24 Vdc backup supply (optional)

## 2.2 Model number

The way in which the model numbers for the Unidrive M range are formed is illustrated below:

Figure 2-1 Model number

## 2.3 Ratings

The drive is single rated.  
 The rating is compatible with motors designed to IEC60034.  
 The graph on the right illustrates Heavy Duty with respect to continuous current rating and short term overload limits.

### Heavy Duty

For constant torque applications or applications which require a high overload capability, or full torque is required at low speeds (e.g. winders, hoists).  
 The thermal protection is set to protect force ventilated induction motors by default.

#### NOTE

If the application uses a self ventilated (TENV/TEFC) induction motor and increased thermal protection is required for speeds below 50 % base speed, then this can be enabled by setting *Low Speed Thermal Protection Mode* (04.025) = 1.

### Operation of motor $I^2t$ protection

Motor  $I^2t$  protection is fixed as shown below and is compatible with:

- Self ventilated (TENV/TEFC) induction motors

Motor  $I^2t$  protection defaults to be compatible with:

- Forced ventilation induction motors

## 2.4 Operating modes

The drive is designed to operate in any of the following modes:

1. Open loop mode
  - Open loop vector mode
  - Fixed V/F mode (V/Hz)
  - Square V/F mode (V/Hz)

### 2.4.1 Open loop mode

The drive applies power to the motor at frequencies varied by the user. The motor speed is a result of the output frequency of the drive and slip due to the mechanical load. The drive can improve the speed control of the motor by applying slip compensation. The performance at low speed depends on whether V/F mode or open loop vector mode is selected.

#### Open loop vector mode

The voltage applied to the motor is directly proportional to the frequency except at low speed where the drive uses motor parameters to apply the correct voltage to keep the flux constant under varying load conditions.

Typically 100 % torque is available down to 1 Hz for a 50 Hz motor.

#### Fixed V/F mode

The voltage applied to the motor is directly proportional to the frequency except at low speed where a voltage boost is provided which is set by the user. This mode can be used for multi-motor applications.

Typically 100 % torque is available down to 4 Hz for a 50 Hz motor.

#### Square V/F mode

The voltage applied to the motor is directly proportional to the square of the frequency except at low speed where a voltage boost is provided which is set by the user. This mode can be used for running fan or pump applications with quadratic load characteristics or for multi-motor applications. This mode is not suitable for applications requiring a high starting torque.

## 2.5 Keypad and display

The keypad and display provide information to the user regarding the operating status of the drive and trip codes, and provide the means for changing parameters, stopping and starting the drive, and the ability to perform a drive reset.

Figure 2-2 Unidrive M100 keypad detail

Figure 2-3 Unidrive M101 keypad detail

- (1) The *Enter* button is used to enter parameter view or edit mode, or to accept a parameter edit.
- (2 / 5) The *Navigation* button can be used to select individual parameters or to edit parameter values.
- (3) The *Stop / Reset* button is used to stop and reset the drive in keypad mode. It can also be used to reset the drive in terminal mode.
- (4) The *Start* button is used to start the drive in keypad mode.
- (6) The *Escape* button is used to exit from the parameter edit / view mode.
- (7) The *Speed Reference Potentiometer* is used to control the speed reference in keypad mode (only on *Unidrive M101*).
- (8) Units.
- (9) Run forward indicator.
- (10) Run reverse indicator.
- (11) Keypad reference indicator.

## 2.6 Nameplate description

Figure 2-4 Typical drive rating labels for size 2

Refer to Figure 2-1 *Model number* on page 7 for further information relating to the labels.

**NOTE**

**Date code format**

The date code is split into two sections: a letter followed by a number. The letter indicates the year, and the number indicates the week number (within the year) in which the drive was built. The letters go in alphabetical order, starting with A in 1991 (B in 1992, C in 1993 etc).

**Example:**

A date code of **W28** would correspond to week 28 of year 2013.

## 2.7 Options

Figure 2-5 Options available with the drive

1. AI-Backup Adaptor

Table 2-1 Adaptor Interface (AI) option module identification

Type	Option module	Name	Further Details
Backup		AI-Backup adaptor	<b>+24 V Backup and SD card interface</b> Provides a +24 V Backup supply input and SD card interface
		AI-Smart adaptor	<b>+24 V Backup and SD card interface</b> Supplied with 4 GB SD card for parameter copying and an input for 24 V Backup

## 3 Mechanical installation

### 3.1 Installing / removing option

Figure 3-1 Installing the AI-Backup adaptor

1. Identify the two plastic fingers on the underside of the AI-Backup adaptor (1) - then insert the two fingers into the corresponding slots in the spring-loaded sliding cover on the top of the drive.
2. Hold the adaptor firmly and push the spring loaded protective cover towards the back of the drive to expose the connector block (2) below.
3. Press the adaptor downwards (3) until the adaptor connector locates into the drive connection below.

Figure 3-2 Removal of the AI-Backup Adaptor

- To remove the AI-Backup adaptor, pull it up away from the drive in the direction shown (1)

## 4 Electrical installation

### 4.1 24 Vdc supply

The 24 Vdc supply connected to the +24 V supply terminals on the AI-Backup adaptor provides the following functions:

- It can be used to clone or load parameters in order to pre-configure drives when the line power supply is not available. The keypad can be used to setup parameters if required. However, the drive will be in the Under Voltage state unless the line power supply is enabled, therefore diagnostics may not be possible. (Power down save parameters are not saved when using the 24 V back-up power supply input).

The working voltage range of the 24 V back-up power supply is as follows:

<b>0V</b>	<b>0V (connected internally to 0V common - Control terminal 1)</b>
<b>+ 24 V</b>	<b>+ 24 V Backup supply input</b>
Nominal operating voltage	24.0 Vdc
Minimum continuous operating voltage	19.2 V
Maximum continuous operating voltage	30.0 V
Minimum start up voltage	12.0 V
Minimum power supply requirement at 24 V	20 W
Recommended fuse	1 A, 50 Vdc

Minimum and maximum voltage values include ripple and noise. Ripple and noise values must not exceed 5 %.

**Figure 4-1 Location of the 24 Vdc power supply connection on the AI-Backup adaptor**

### 4.2 Control connections

#### 4.2.1 General

Table 4-1 The control connections consist of:

Function	Qty	Control parameters available	Terminal number
Single ended analog input	1	Mode, offset, invert, scaling, destination	2
Digital input	3	Destination, invert	11, 12, 13
Digital input / output	1	Input / output mode select, destination / source, invert	10
PWM or frequency output	1	Source, scaling, maximum output frequency, mode	10
Relay	1	Source, invert	41, 42
Drive enable	1		11
+10 V User output	1		4
+24 V User output	1		9
0V common	1		1

**Key:**

Destination parameter:	Indicates the parameter which is being controlled by the terminal / function
Source parameter:	Indicates the parameter being output by the terminal
Mode parameter:	Analog - indicates the mode of operation of the terminal, i.e. voltage 0-10 V, current 4-20 mA etc. Digital - indicates the mode of operation of the terminal, (the Drive Enable terminal is fixed in positive logic).

All analog terminal functions can be programmed in menu 7.

All digital terminal functions (including the relay) can be programmed in menu 8.

**WARNING** The control circuits are isolated from the power circuits in the drive by basic insulation (single insulation) only. The installer must ensure that the external control circuits are insulated from human contact by at least one layer of insulation (supplementary insulation) rated for use at the AC supply voltage.

**WARNING** If the control circuits are to be connected to other circuits classified as Safety Extra Low Voltage (SELV) (e.g. to a personal computer), an additional isolating barrier must be included in order to maintain the SELV classification.

**CAUTION** If any of the digital inputs (including the drive enable input) are connected in parallel with an inductive load (i.e. contactor or motor brake) then suitable suppression (i.e. diode or varistor) should be used on the coil of the load. If no suppression is used then over voltage spikes can cause damage to the digital inputs and outputs on the drive.

**NOTE**

Any signal cables which are carried inside the motor cable (i.e. motor thermistor, motor brake) will pick up large pulse currents via the cable capacitance. The shield of these signal cables must be connected to ground close to the point of exit of the motor cable, to avoid this noise current spreading through the control system.

Figure 4-2 Default terminal functions

#### 4.2.2 Control terminal specification

<b>1</b>	<b>0V common</b>
Function	Common connection for all external devices

<b>2</b>	<b>Analog input 1</b>
Default function	Frequency reference
Type of input	Unipolar single-ended analog voltage or unipolar current
Mode controlled by...	Pr <b>07.007</b>
<b>Operating in voltage mode (default)</b>	
Full scale voltage range	0V to +10 V $\pm 3\%$
Maximum offset	$\pm 30$ mV
Absolute maximum voltage range	-18 V to +30 V relative to 0V
Input resistance	100 k $\Omega$
<b>Operating in current mode</b>	
Current ranges	0 to 20 mA $\pm 5\%$ , 20 to 0 mA $\pm 5\%$ , 4 to 20 mA $\pm 5\%$ , 20 to 4 mA $\pm 5\%$
Maximum offset	250 $\mu$ A
Absolute maximum voltage (reverse bias)	-18 V to +30 V relative to 0V
Absolute maximum current	25 mA
Equivalent input resistance	165 $\Omega$
<b>Common to all modes</b>	
Resolution	11 bits
Sample rate	4 ms

<b>4</b>	<b>+10 V user output</b>
Default function	Supply for external analog devices
Nominal voltage	10.2 V
Voltage tolerance	$\pm 3\%$
Maximum output current	5 mA

<b>9</b>	<b>+24 V user output</b>
<b>Default function</b>	<b>Supply for external digital devices</b>
Voltage tolerance	±20 %
Maximum output current	100 mA
Protection	Current limit and trip

<b>10</b>	<b>Digital I/O 1</b>
<b>Default function</b>	<b>AT ZERO FREQUENCY output</b>
Type	Positive logic digital input, positive logic voltage source output. PWM or frequency output modes can be selected.
Input / output mode controlled by ...	Pr <b>08.031</b>
<b>Operating as in input</b>	
Absolute maximum applied voltage range	-8 V to +30 V relative to 0V
Impedance	6.8 kΩ
Input threshold	10 V ±0.8 V (IEC 61131-2)
<b>Operating as an output</b>	
Nominal maximum output current	50 mA
Maximum output current	100 mA (total including +24 Vout)
<b>Common to all modes</b>	
Voltage range	0V to +24 V
Sample rate	1 ms when routed to destinations Pr <b>06.035</b> or Pr <b>06.036</b> , otherwise 4 ms

<b>11</b>	<b>Digital Input 2</b>
<b>12</b>	<b>Digital Input 3</b>
<b>13</b>	<b>Digital Input 4</b>
<b>Terminal 11 default function</b>	<b>DRIVE ENABLE input</b>
<b>Terminal 12 default function</b>	<b>RUN FORWARD input</b>
<b>Terminal 13 default function</b>	<b>RUN REVERSE input</b>
Type	Positive logic only digital inputs
Voltage range	0V to +24 V
Absolute maximum applied voltage range	-18 V to +30 V relative to 0V
Impedance	6.8 kΩ
Input threshold	10 V ±0.8 V (IEC 61131-2)
Sample rate	1 ms when routed to destinations Pr <b>06.035</b> or Pr <b>06.036</b> , otherwise 4 ms.

<b>41</b>	<b>Relay contacts</b>
<b>42</b>	
<b>Default function</b>	<b>Drive OK indicator</b>
Contact voltage rating	240 Vac, Installation over-voltage category II
Contact maximum current rating	2 A AC 240 V 4 A DC 30 V resistive load 0.5 A DC 30 V inductive load (L/R = 40 ms)
Contact minimum recommended rating	12 V 100 mA
Contact type	Normally open
Default contact condition	Closed when power applied and drive OK
Update rate	1 ms

To prevent the risk of a fire hazard in the event of a fault, a fuse or other over-current protection must be installed in the relay circuit.

## 5 Getting started

This chapter introduces the user interfaces, menu structure and security levels of the drive.

### 5.1 Understanding the display

#### 5.1.1 Keypad

The keypad display consists of a 6 digit LED display. The display shows the drive status or the menu and parameter number currently being edited.

The mm.ppp signifies the menu parameter number of the drive's menus and parameter.

The display also includes LED indicators showing units and status as shown in Figure 5-1.

When the drive is powered up, the display will show the power up parameter defined by *Parameter Displayed At Power-Up* (11.022).

#### NOTE

The values in the *Status Mode Parameters* (11.018 and 11.019) shown on the display when the drive is running, can be toggled by using the escape button.

Figure 5-1 Unidrive M100 keypad detail

Table 5-1 Key to Figure 5-1

- |                            |                         |
|----------------------------|-------------------------|
| 1: Enter button            | 4: Start button (green) |
| 2: Up button               | 5: Down button          |
| 3: Stop/Reset button (red) | 6: Escape button        |

Figure 5-2 Unidrive M101 keypad detail

Table 5-2 Key to Figure 5-2

- |                                  |                                |
|----------------------------------|--------------------------------|
| 7: Speed reference potentiometer | 10: Run reverse indicator      |
| 8: Unit indicators               | 11: Keypad reference indicator |
| 9: Run forward indicator         |                                |

#### NOTE

The red stop button  is also used to reset the drive.

On the Unidrive M101, the speed reference potentiometer is used to adjust the keypad reference.

The parameter value is correctly displayed on the keypad display as shown in Table 5-3 below.

Table 5-3 Keypad display formats

Display formats	Value
Standard	100.99
Date	31.12.11 or 12.31.11
Time	12.34.56
Character	ABCDEF
Binary	5
Version number	01.23.45

### 5.2 Keypad operation

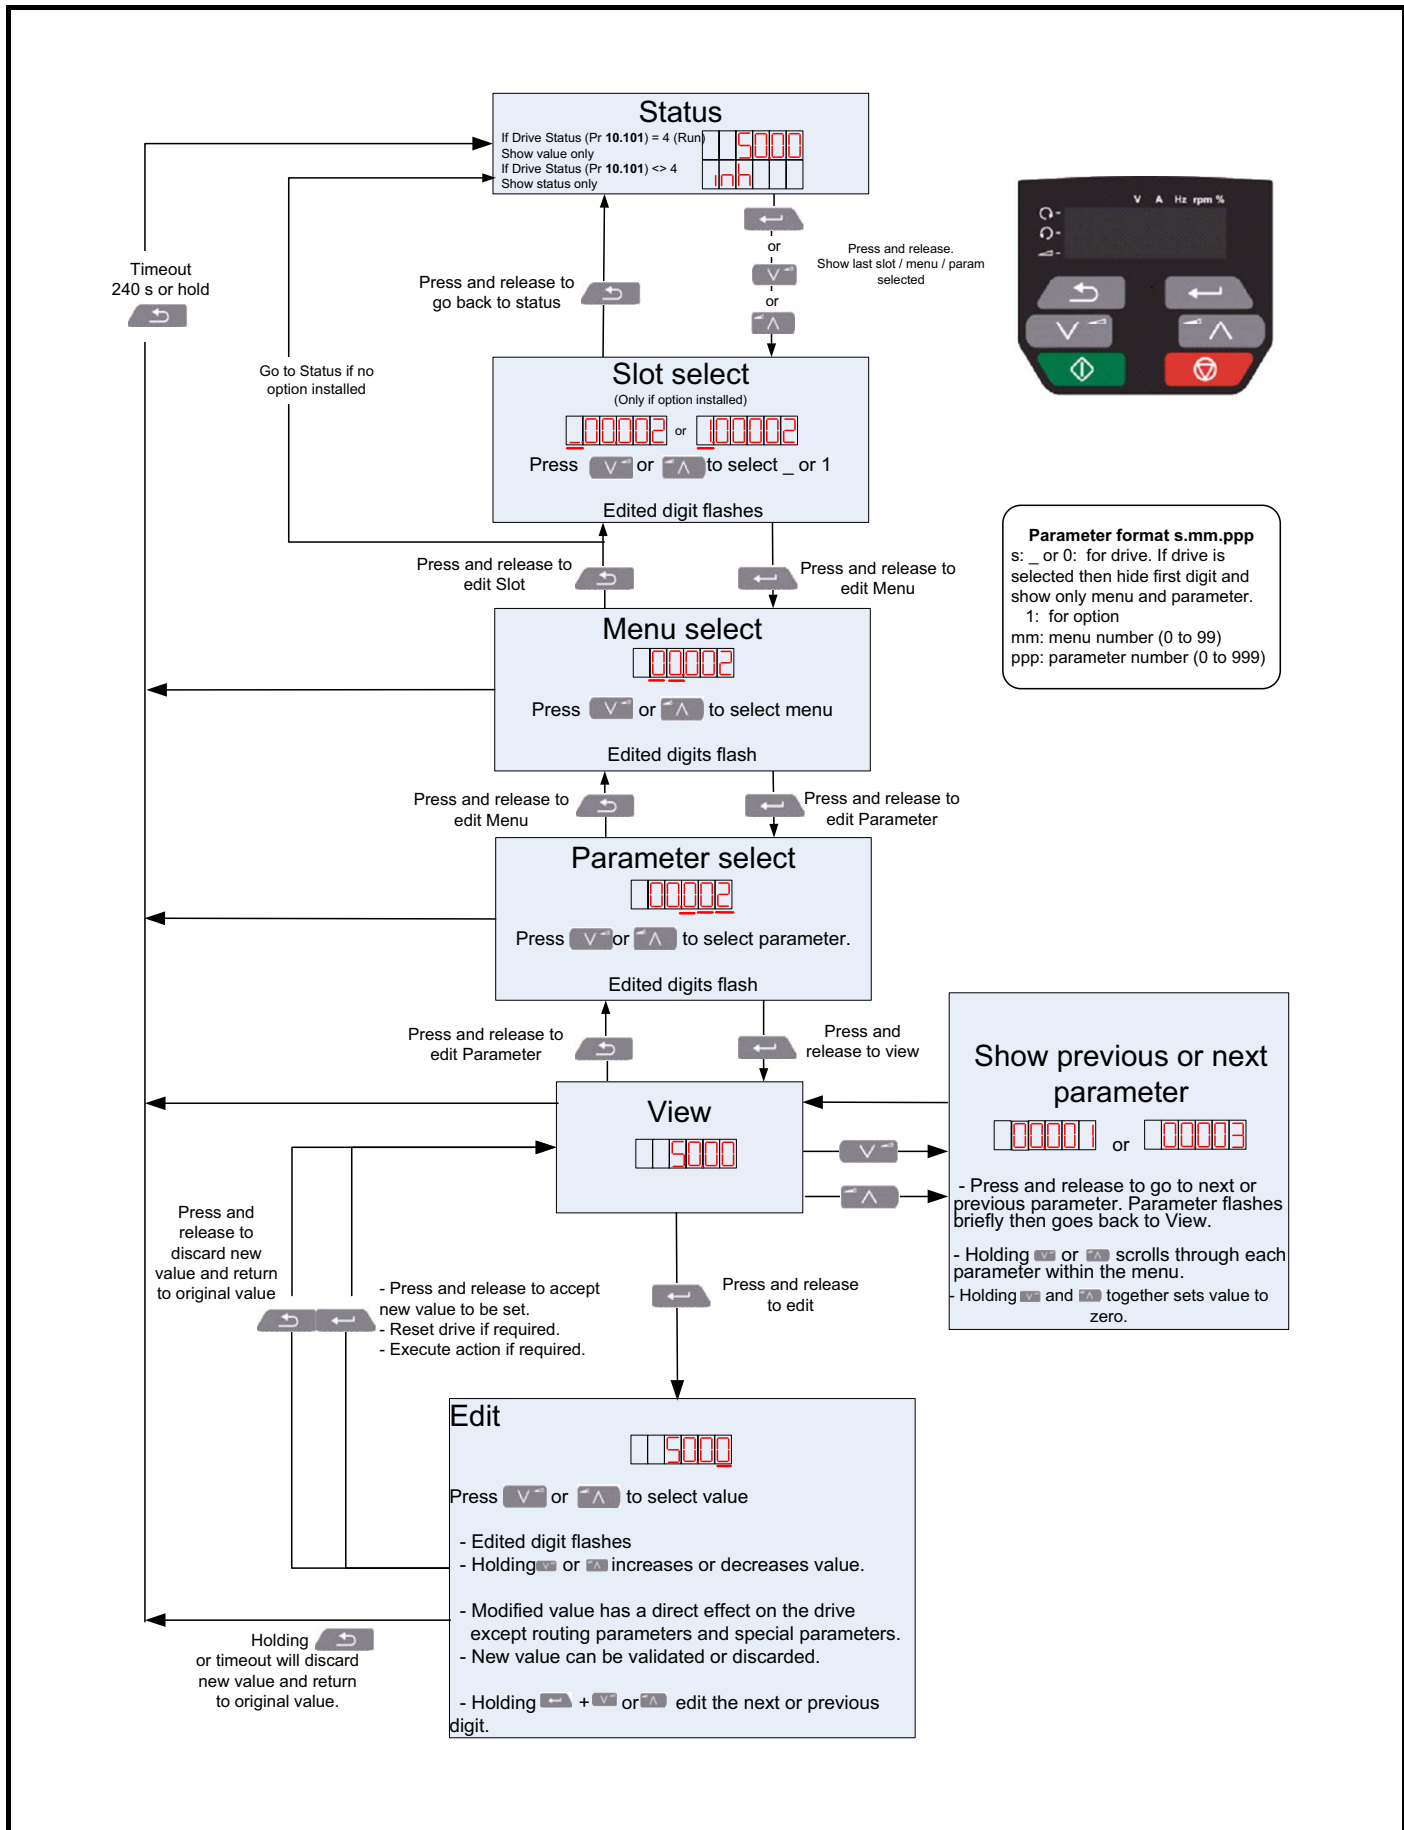

#### 5.2.1 Control buttons

The keypad consists of:

- Up and down button - Used to navigate the parameter structure and change parameter values.
- Enter button - Used to change between parameter edit and view mode, as well as entering data.
- Escape button - Used to exit from parameter edit or view mode. In parameter edit mode, if parameter values are edited and the escape button pressed, the parameter value will be restored to the value it had on entry to edit mode.
- Start button - Used to provide a 'Run' command if keypad mode is selected.
- Stop / Reset button - Used to reset the drive. In keypad mode can be used for 'Stop'.

Figure 5-3 Display modes

**NOTE**

The up and down buttons can only be used to move between menus if Pr **00.010** has been set to show 'ALL'. Refer to section 5.8 *Parameter access level and security* on page 20.

**Figure 5-4 Mode examples**

1 Parameter view mode: Read write or Read only

2 Status mode: Drive OK status

If the drive is ok and the parameters are not being edited or viewed, the display will show one of the following:

inh', 'rdy' or status mode parameter value.

3 Status mode: Trip status

When the drive is in trip condition, the display will indicate that the drive has tripped and the display will show the trip code. For further information regarding trip codes, refer to section 11.4 *Trips, Sub-trip numbers* on page 81.

4 Status mode: Alarm status

During an 'alarm' condition the display flashes between the drive status parameter value and the alarm.

**WARNING**

Do not change parameter values without careful consideration; incorrect values may cause damage or a safety hazard.

**NOTE**

When changing the values of parameters, make a note of the new values in case they need to be entered again.

**NOTE**

New parameter values must be saved to ensure that the new values apply after the drive has been power cycled. Refer to section 5.6 *Saving parameters* on page 19.

### 5.3 Menu structure

The drive parameter structure consists of menus and parameters.

The drive initially powers up so that only Menu 0 can be viewed. The up and down arrow buttons are used to navigate between parameters and once Pr **00.010** has been set to 'All' the up and down buttons are used to navigate between menus.

For further information refer to section 5.8 *Parameter access level and security* on page 20.

The menus and parameters rollover in both directions i.e. if the last parameter is displayed, a further press will cause the display to rollover and show the first parameter.

When changing between menus, the drive remembers which parameter was last viewed in a particular menu and thus displays that parameter.

### 5.4 Menu 0

Menu 0 is used to bring together various commonly used parameters for basic easy set up of the drive. The parameters displayed in Menu 0 can be configured in Menu 22.

Appropriate parameters are copied from the advanced menus into Menu 0 and thus exist in both locations.

For further information, refer to Chapter 6 *Basic parameters* on page 21.

**Figure 5-5 Menu 0 copying**

## 5.5 Advanced menus

The advanced menus consist of groups or parameters appropriate to a specific function or feature of the drive. Menus 0 to 22 can be viewed on the Keypad.

**Table 5-4 Advanced menu descriptions**

Menu	Description
0	Commonly used basic set up parameters for quick / easy programming
1	Frequency reference
2	Ramps
3	Frequency control
4	Torque and current control
5	Motor control
6	Sequencer and clock
7	Analog I/O
8	Digital I/O
10	Status and trips
11	Drive set-up and identification
22	Menu 0 set-up

### 5.5.1 Display messages

The following tables indicate the various possible mnemonics which can be displayed by the drive and their meaning.

**Table 5-5 Status indications**

String	Description	Drive output stage
inh	The drive is inhibited and cannot be run. The Drive Enable signal is not applied to the drive enable terminal or Pr <b>06.015</b> is set to 0. The other conditions that can prevent the drive from enabling are shown as bits in <i>Enable Conditions</i> (06.010)	Disabled
rdy	The drive is ready to run. The drive enable is active, but the drive inverter is not active because the final drive run is not active	Disabled
StoP	The drive is stopped / holding zero speed.	Enabled
S.Loss	Supply loss condition has been detected	Enabled
dc inj	The drive is applying dc injection braking	Enabled
Er	The drive has tripped and no longer controlling the motor. The trip code appears on the display.	Disabled
UV	The drive is in the under voltage state either in low voltage or high voltage mode.	Disabled
HEAt	The motor pre-heat function is active.	Enabled

### 5.5.2 Alarm indications

An alarm is an indication given on the display by alternating the alarm string with the drive status string on the display. Alarms strings are not displayed when a parameter is being edited.

**Table 5-6 Alarm indications**

Alarm string	Description
br.res	Brake resistor overload. <i>Braking Resistor Thermal Accumulator</i> (10.039) in the drive has reached 75.0 % of the value at which the drive will trip.
OV.Ld	<i>Motor Protection Accumulator</i> (04.019) in the drive has reached 75.0 % of the value at which the drive will trip and the load on the drive is >100 %.
d.OV.Ld	Drive over temperature. <i>Percentage Of Drive Thermal Trip Level</i> (07.036) in the drive is greater than 90 %.
tuning	The autotune procedure has been initialized and an autotune in progress.
LS	Limit switch active. Indicates that a limit switch is active and that is causing the motor to be stopped.
Lo.AC	Low voltage mode. See <i>Low AC Alarm</i> (10.107).
I.AC.Lt	Current limit active. See <i>Current Limit Active</i> (10.009).
24.LoSt	24 V backup not present. See <i>24V Alarm Loss Enable</i> (11.098).

## 5.6 Saving parameters

When changing a parameter in Menu 0, the new value is saved when pressing the Enter button  to return to parameter view mode from parameter edit mode.

If parameters have been changed in the advanced menus, then the change will not be saved automatically. A save function must be carried out.

### Procedure

1. Select 'Save' in Pr **mm.000** (alternatively enter a value of 1001 in Pr **mm.000**)

- Press the red  reset button

## 5.7 Restoring parameter defaults

Restoring parameter defaults by this method saves the default values in the drives memory. *User security status* (00.010) and *User security code* (00.025) are not affected by this procedure).

### Procedure

1. Ensure the drive is not enabled, i.e. drive is in inhibit or under voltage state.
  2. Select 'Def.50' or 'Def.60' in Pr **mm.000**. (alternatively, enter 1233 (50 Hz settings) or 1244 (60 Hz settings) in Pr **mm.000**).
- Press the red  reset button

## 5.8 Parameter access level and security

The parameter access level determines whether the user has access to Menu 0 only or to all the advanced menus (Menus 1 to 22) in addition to Menu 0.

The User Security determines whether the access to the user is read only or read write.

Both the User Security and Parameter Access Level can operate independently of each other as shown in Table 5-7.

**Table 5-7 Parameter access level and security**

User security status (00.010)	Access level	User security (00.025)	Menu 0 status	Advanced menu status
0	Menu 0	None	RW	Not visible
1	All Menus	None	RW	RW
2	Read-only Menu 0	Open	RW	Not visible
		Closed	RO	Not visible
3	Read-only	Open	RW	RW
		Closed	RO	RO
4	Status only	Open	RW	RW
		Closed	Not visible	Not visible
5	No access	Open	RW	RW
		Closed	Not visible	Not visible

The default settings of the drive are Parameter Access Level Menu 0 and user Security Open i.e. read / write access to Menu 0 with the advanced menus not visible.

### 5.8.1 User Security Level / Access Level

The drive provides a number of different levels of security that can be set by the user via *User Security Status* (00.010); these are shown in the table below.

User Security Status (Pr 00.010)	Description
LEVEL.0 (0)	All writable parameters are available to be edited but only parameters in Menu 0 are visible
ALL (1)	All parameters are visible and all writable parameters are available to be edited
r.only.0 (2)	Access is limited to Menu 0 parameters only. All parameters are read-only
r.only.A (3)	All parameters are read-only however all menus and parameters are visible
Status (4)	The keypad remains in status mode and no parameters can be viewed or edited
no.acc (5)	The keypad remains in status mode and no parameters can be viewed or edited.

### 5.8.2 Changing the User Security Level /Access Level

The security level is determined by the setting of Pr **00.010** or Pr **11.044**. The Security Level can be changed through the keypad even if the User Security Code has been set.

#### 5.8.3 User Security Code

The User Security Code, when set, prevents write access to any of the parameters in any menu.

##### Setting User Security Code

Enter a value between 1 and 9999 in Pr **00.025** and press the  button; the security code has now been set to this value. In order to activate the security, the Security level must be set to desired level in Pr **00.010**. When the drive is reset, the security code will have been activated and the drive returns to Menu 0. The value of Pr **00.025** will return to 0 in order to hide the security code.

##### Unlocking User Security Code

Select a parameter that need to be edited and press the  button, the display will now show 'Co'. Use the arrow buttons to set the security code and press the  button. With the correct security code entered, the display will revert to the parameter selected in edit mode.

If an incorrect security code is entered, the following message 'Co.Err' is displayed, and the display will revert to parameter view mode.

##### Disabling User Security

Unlock the previously set security code as detailed above. Set Pr **00.025** to 0 and press the  button. The User Security has now been disabled, and will not have to be unlocked each time the drive is powered up to allow read / write access to the parameters.

## 5.9 Displaying parameters with non-default values only

By selecting 'diff.d' in Pr **mm.000** (Alternatively, enter 12000 in Pr **mm.000**), the only parameters that will be visible to the user will be those containing a non-default value. This function does not require a drive reset to become active. In order to deactivate this function, return to Pr **mm.000** and select 'none' (alternatively enter a value of 0). Please note that this function can be affected by the access level enabled, refer to section 5.8 *Parameter access level and security* on page 20 for further information regarding access level.

## 5.10 Displaying destination parameters only

By selecting 'dest' in Pr **mm.000** (Alternatively enter 12001 in Pr **mm.000**), the only parameters that will be visible to the user will be destination parameters. This function does not require a drive reset to become active. In order to deactivate this function, return to Pr **mm.000** and select 'none' (alternatively enter a value of 0).

Please note that this function can be affected by the access level enabled, refer to section 5.8 *Parameter access level and security* on page 20 for further information regarding access level.

## 6 Basic parameters

Menu 0 is used to bring together various commonly used parameters for basic easy set up of the drive. All the parameters in Menu 0 appear in other menus in the drive (denoted by {...}). Menu 22 can be used to configure the parameters in Menu 0.

### 6.1 Parameter ranges and Variable minimum/maximums:

Some parameters in the drive have a variable range with a variable minimum and a variable maximum value which is dependent on one of the following:

- The settings of other parameters
- The drive rating
- The drive mode
- Combination of any of the above

For more information please see section 10.1 *Parameter ranges and Variable minimum/maximums*: on page 47.

## 6.2 Menu 0: Basic parameters

Parameter		Range (⚡)		Default (⇒)		Type							
		OL		OL									
00.001	Minimum Reference Clamp	{01.007}	VM_NEGATIVE_REF_CLAMP 1 Hz		0.00 Hz		RW	Num					US
00.002	Maximum Reference Clamp	{01.006}	VM_POSITIVE_REF_CLAMP Hz		50 Hz default: 50.00 Hz 60 Hz default: 60.00 Hz		RW	Num					US
00.003	Acceleration Rate 1	{02.011}	0.0 to VM_ACCEL_RATE s / 100 Hz		5.0 s / 100 Hz		RW	Num					US
00.004	Deceleration Rate 1	{02.021}	0.0 to VM_ACCEL_RATE s / 100 Hz		10.0 s / 100 Hz		RW	Num					US
00.005	Drive Configuration	{11.034}	AV (0), AI (1), AV.Pr (2), AI.Pr (3), PrESet (4), PAd (5), PAd.rEF (6), E.Pot (7), torque (8)		AV (0)*		RW	Txt				PT	US
00.006	Motor Rated Current	{05.007}	0.00 to VM_RATED_CURRENT A		Maximum Heavy Duty Rating (11.032) A		RW	Num		RA			US
00.007	Motor Rated Speed	{05.008}	0.0 to 33000.0 rpm		50 Hz default: 1500.0 rpm 60 Hz default: 1800.0 rpm		RW	Num					US
00.008	Motor Rated Voltage	{05.009}	0 to VM_AC_VOLTAGE_SET V		110 V drive: 230 V 200 V drive: 230 V 400 V drive 50 Hz: 400 V 400 V drive 60 Hz: 460 V 575 V drive: 575 V 690 V drive: 690 V		RW	Num		RA			US
00.009	Motor Rated Power Factor**	{05.010}	0.00 to 1.00		0.85		RW	Num		RA			US
00.010	User Security Status	{11.044}	LEVEL.0 (0), ALL (1), r.only.0 (2), r.only.A (3), Status (4), no.acc (5)		LEVEL.0 (0)		RW	Num	ND	NC	PT		
00.015	Jog Reference	{01.005}	0.00 to 300.00 Hz		1.50 Hz		RW	Num					US
00.016	Analog Input 1 Mode	{07.007}	4-20.S (-6), 20-4.S (-5), 4-20.L (-4), 20-4.L (-3), 4-20.H (-2), 20-4.H (-1), 0-20 (0), 20-0 (1), 4-20.tr (2), 20-4.tr (3), 4-20 (4), 20-4 (5), Volt (6)		Volt (6)		RW	Txt					US
00.017	Bipolar Reference Enable	{01.010}	Off (0) or On (1)		Off (0)		RW	Bit					US
00.018	Preset Reference 1	{01.021}	VM_SPEED_FREQ_REF Hz		0.00 Hz		RW	Num					US
00.025	User Security Code	{11.030}	0 to 9999		0		RW	Num	ND	NC	PT		US
00.027	Power-up Keypad Control Mode Reference	{01.051}	Reset (0), Last (1), Preset (2)		Reset (0)		RW	Txt					US
00.028	Ramp Mode Select	{02.004}	Fast (0), Std (1), Std.bst (2), Fst.bst (3)		Std (1)		RW	Txt					US
00.030	Parameter Cloning	{11.042}	NonE (0), rEAd (1), Prog (2), Auto (3), boot (4)		NonE (0)		RW	Txt		NC			US
00.031	Stop Mode	{06.001}	Coast (0), rp (1), rp.dc I (2), dc I (3), td.dc I (4),dis (5),		rp (1)		RW	Txt					US
00.032	Dynamic V to F Select	{05.013}	0 to 1		0		RW	Num					US
00.033	Catch A Spinning Motor	{06.009}	dis (0), Enable (1), Fr.Only (2), Rv.Only (3)		dis (0)		RW	Txt					US
00.035	Digital Output 1 Control	{08.091}	0 to 21		0		RW						US
00.037	Maximum Switching Frequency	{05.018}	0.667 (0), 1 (1), 2 (2), 3 (3), 4 (4), 6 (5), 8 (6), 12 (7), 16 (8) kHz		3 (3) kHz		RW	Txt					US
00.038	Autotune	{05.012}	0 to 2		0		RW	Num		NC			US
00.039	Motor Rated Frequency	{05.006}	0.0 to 550.00 Hz		50 Hz: 50.00 Hz 60 Hz: 60.00 Hz		RW	Num		RA			US
00.040	Number of Motor Poles	{05.011}	Auto (0) to 32 (16)		Auto 0		RW	Num					US
00.041	Control Mode	{05.014}	Ur.S (0), Ur (1), Fd (2), Ur.Auto (3), Ur.l (4), SrE (5), Fd.tAP (6)		Ur.l (4)		RW	Txt					US
00.042	Low Frequency Voltage Boost	{05.015}	0.0 to 25.0 %		3.0 %		RW	Num					US
00.069	Spin Start Boost	{05.040}	0.0 to 10.0		1.0		RW						US
00.076	Action on Trip Detection	{10.037}	0 to 31		0		RW						US
00.077	Maximum Heavy Duty Current Rating	{11.032}	0.00 to 9999.99 A				RO	Num	ND	NC	PT		
00.078	Software Version	{11.029}	0 to 999999				RO		ND	NC	PT		
00.079	User Drive Mode	{11.031}	OPEn.LP (1)		OPEn.LP (1)		RW	Txt	ND	NC	PT		US

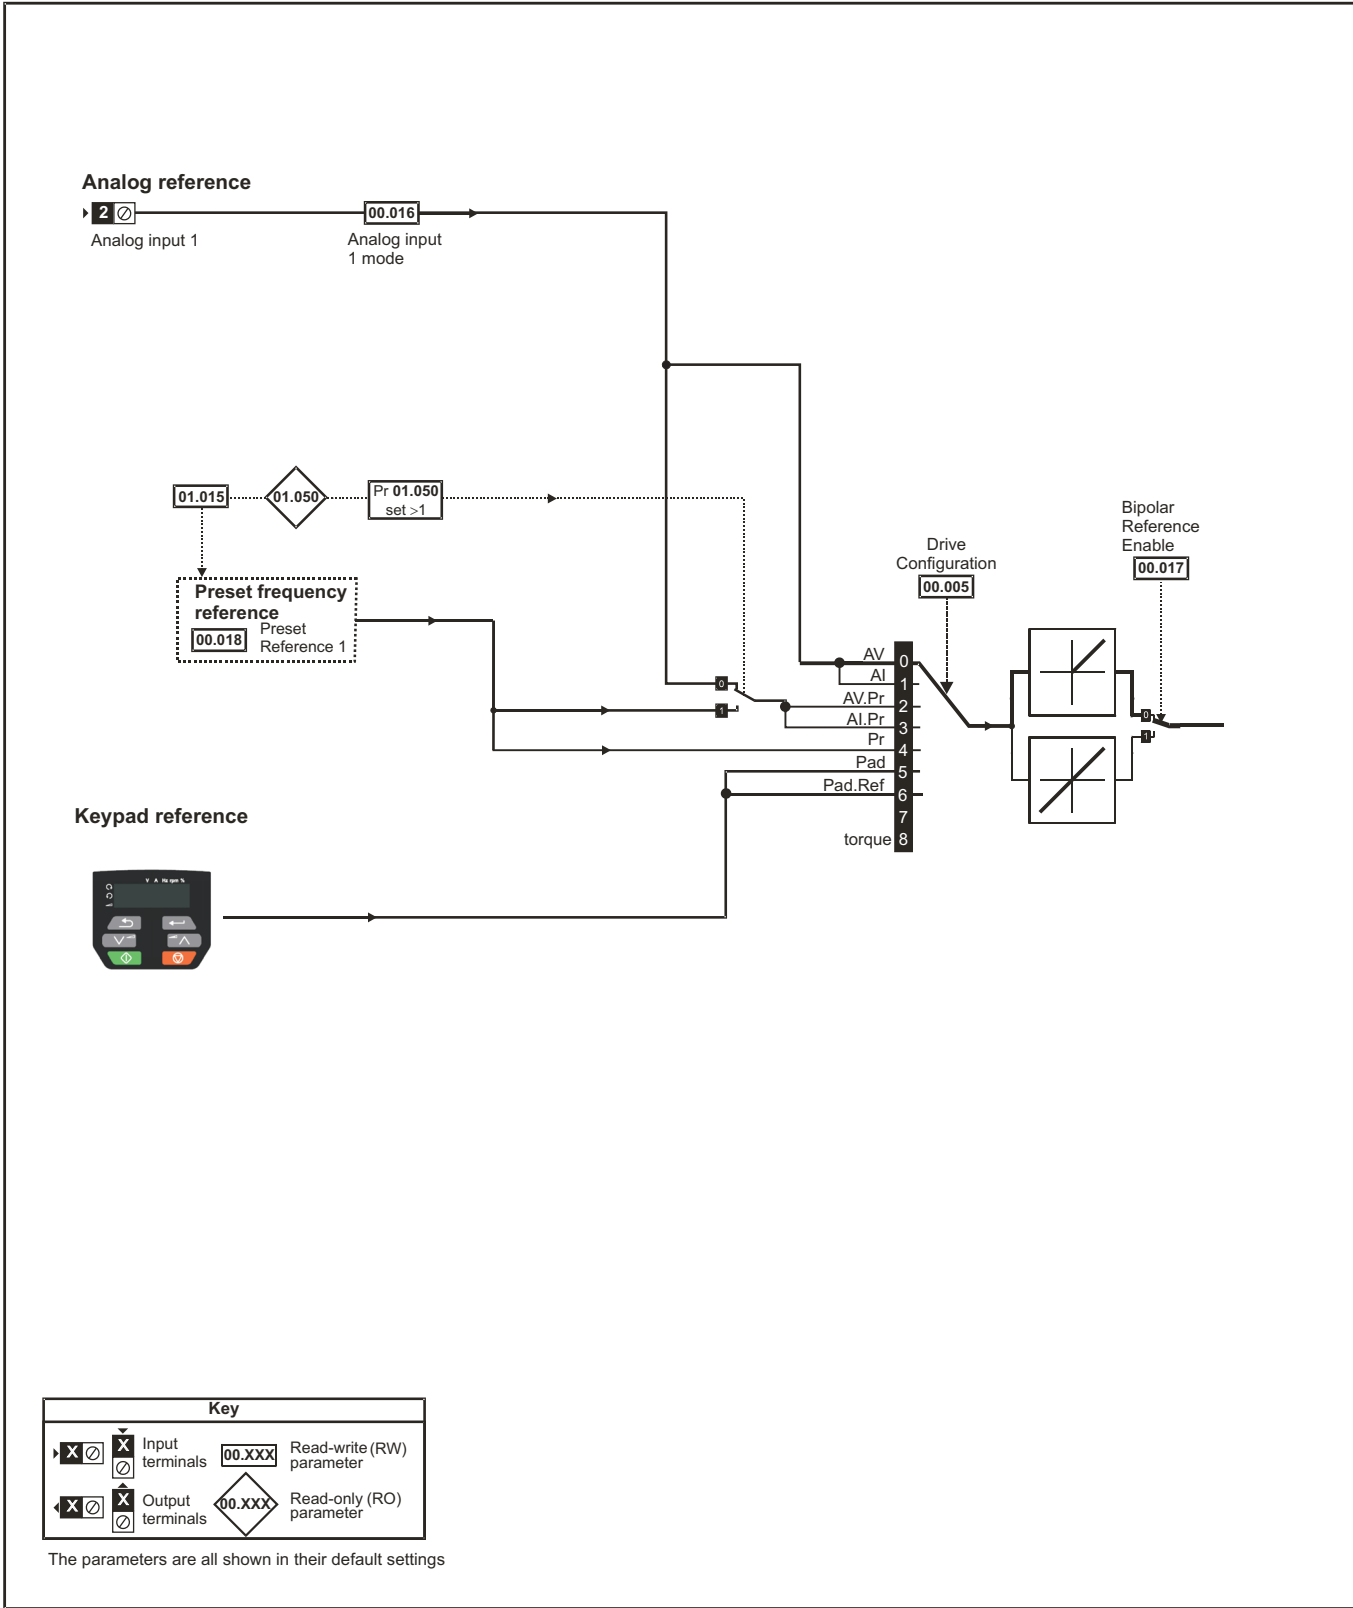

\* With Unidrive M101, the default is PAd (5).

\*\* Following a rotating autotune Pr 00.009 {05.010} is continuously written by the drive, calculated from the value of *Stator Inductance* (Pr 05.025). To manually enter a value into Pr 00.009 {05.010}, Pr 05.025 will need to be set to 0. Refer to the description of Pr 05.010 in the *Parameter Reference Guide* for further details.

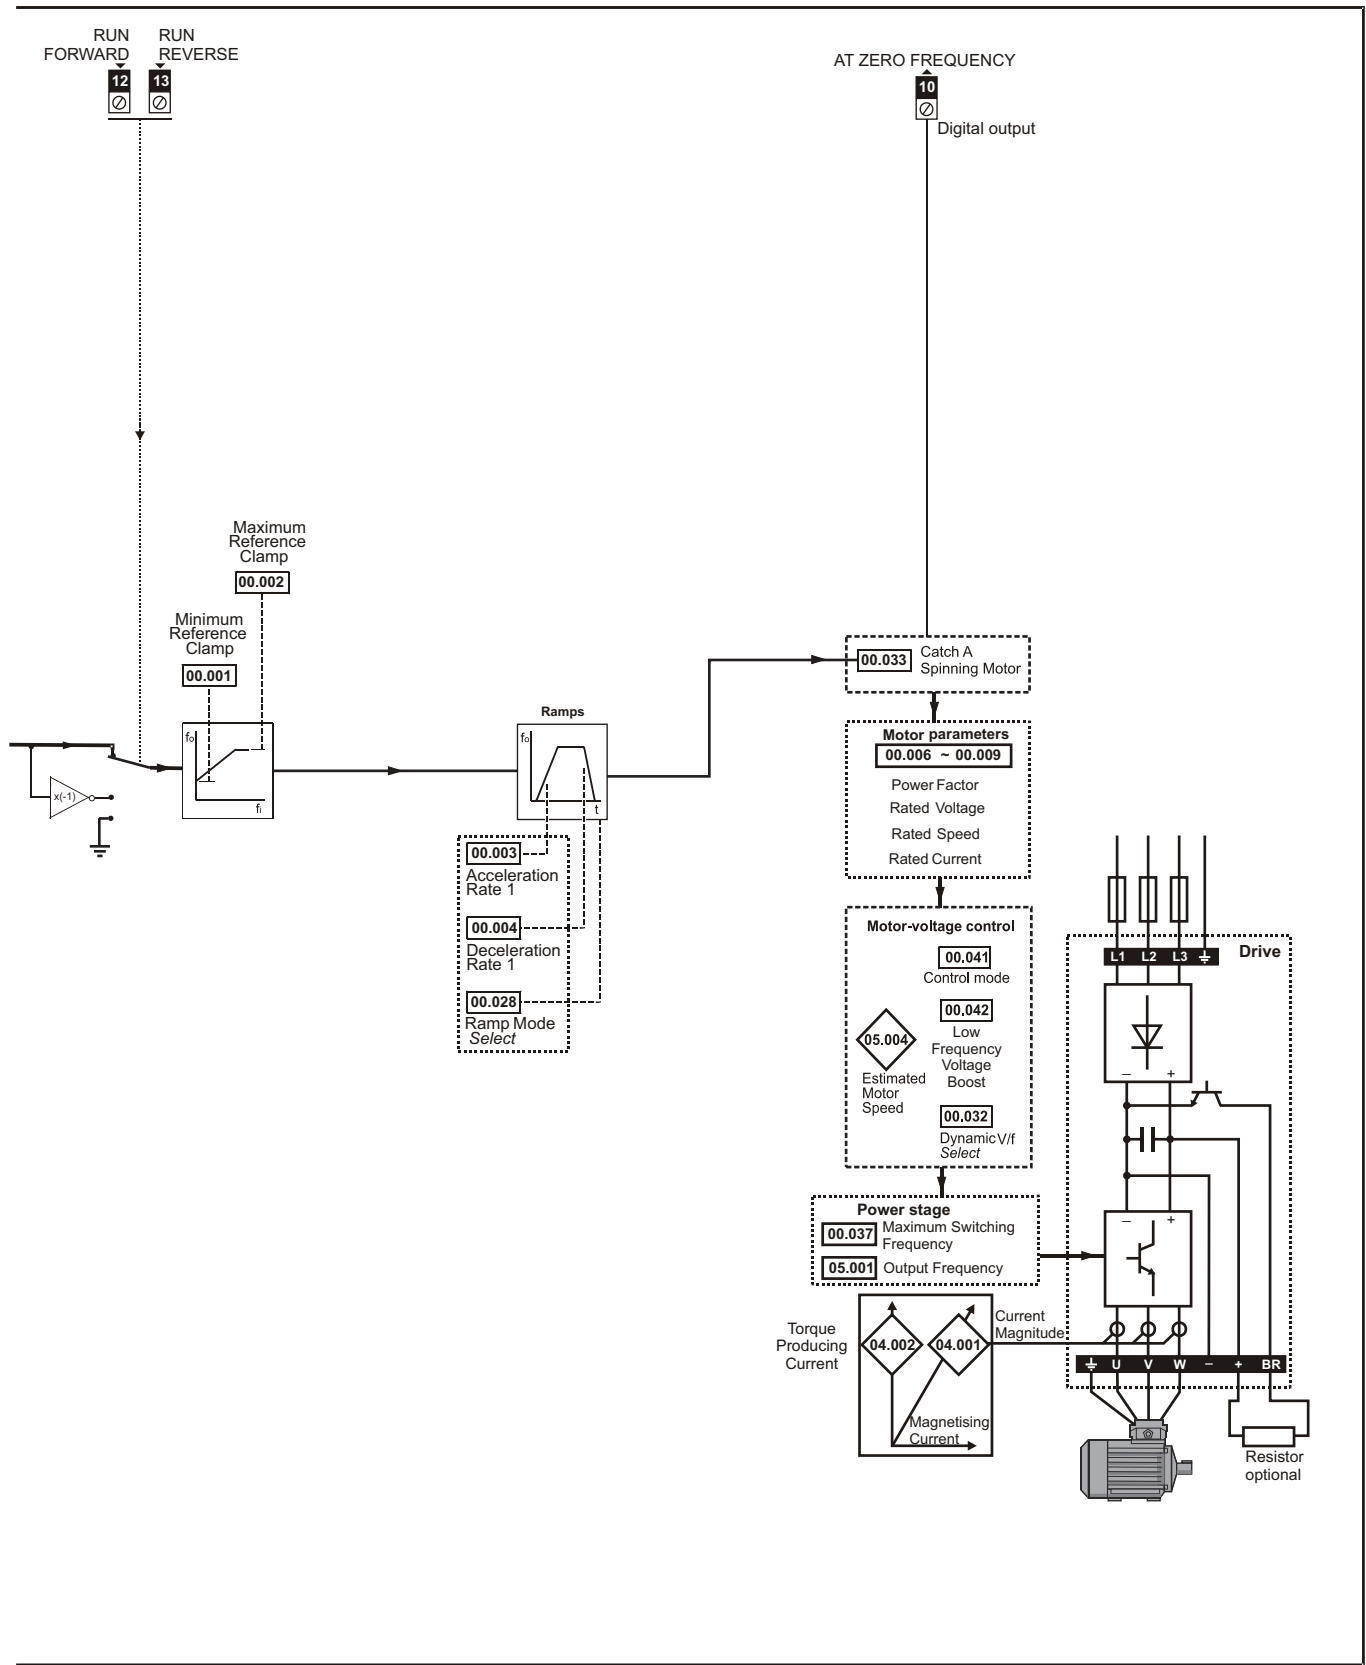

RW	Read / Write	RO	Read only	Num	Number parameter	Bit	Bit parameter	Txt	Text string	Bin	Binary parameter	FI	Filtered
ND	No default value	NC	Not copied	PT	Protected parameter	RA	Rating dependent	US	User save	PS	Power-down save	DE	Destination

Figure 6-1 Menu 0 logic diagram

## 6.3 Parameter descriptions

### 6.3.1 Pr mm.000

Pr **mm.000** is available in all menus, commonly used functions are provided as text strings in Pr **mm.000** shown in Table 6-1. The functions in Table 6-1 can also be selected by entering the appropriate numeric values (as shown in Table 6-2) in Pr **mm.000**. For example, enter 4001 in Pr **mm.000** to store drive parameters on an NV media card.

**Table 6-1 Commonly used functions in xx.000**

Value	Equivalent value	String	Action
0	0	<b>None</b>	No action
1001	1	<b>SAVE</b>	Save drive parameters to non-volatile memory
6001	2	<b>LOAd.1</b>	Load the data from file 1 on a non-volatile media card into the drive provided it is a parameter file
4001	3	<b>SAVE.1</b>	Store the drive parameters in file 1 on a non-volatile media card
6002	4	<b>LOAd.2</b>	Load the data from file 2 on a non-volatile media card into the drive provided it is a parameter file
4002	5	<b>SAVE.2</b>	Store the drive parameters in file 2 on a non-volatile media card
6003	6	<b>LOAd.3</b>	Load the data from file 3 on a non-volatile media card into the drive provided it is a parameter file
4003	7	<b>SAVE.3</b>	Store the drive parameters in file 3 on a non-volatile media card
12000	8	<b>diff.d</b>	Only display parameters that are different from their default value
12001	9	<b>dest</b>	Only display parameters that are used to set-up destinations
1233	10	<b>def.50</b>	Load 50 Hz defaults
1244	11	<b>def.60</b>	Load 60 Hz defaults

**Table 6-2 Functions in Pr mm.000**

Value	Action
1000	Save parameters when <i>Under Voltage Active</i> (Pr <b>10.016</b> ) is not active.
1001	Save parameters under all conditions
1233	Load standard (50 Hz) defaults
1244	Load US (60 Hz) defaults
1299	Reset {St.HF} trip.
2001*	Create a boot file on a non-volatile media card based on the present drive parameters
4yyy*	NV media card: Transfer the drive parameters to parameter file yyy
6yyy*	NV media card: Load the drive parameters from parameter file yyy
7yyy*	NV media card: Erase file yyy
8yyy*	NV Media card: Compare the data in the drive with file yyy
9555*	NV media card: Clear the warning suppression flag
9666*	NV media card: Set the warning suppression flag
9777*	NV media card: Clear the read-only flag
9888*	NV media card: Set the read-only flag
12000**	Only display parameters that are different from their default value. This action does not require a drive reset.
12001**	Only display parameters that are used to set-up destinations (i.e. DE format bit is 1). This action does not require a drive reset.

\* See Chapter 9 *NV Media Card* on page 40 for more information on these functions.

\*\* These functions do not require a drive reset to become active.

All other functions require a drive reset to initiate the function. Equivalent values and strings are also provided in the table above.

## 6.4 Control terminal configurations and wiring

00.005		Drive Configuration										
RW	Txt							PT	US			
OL	↕	AV (0), AI (1), AV.Pr (2), AI.Pr (3), PrESEt (4), PAd (5), PAd.rEF (6), torquE (8)					⇒	AV (0)*				

\* With Unidrive M101, the default is PAd (5).

**Table 6-3** Parameter changes when drive configuration is changed

Parameter number	Description	Drive configuration							
		AV	AI	AV.Pr	AI.Pr	PrESEt	PAd	PAd.rEF	torquE

**Note 1:**

If last default setting was 50 Hz or in PAd or PAd.rEF configuration: Pr **06.004** is 0.

If last default setting was 60 Hz: Pr **06.004** is 4.

**Note 2:**

If last default setting was 50 Hz or in PAd or PAd.rEF configuration: Pr **08.022** is 06.038.

If last default setting was 60 Hz: Pr **08.022** is 06.039.

**Note 3:**

If last default setting was 50 Hz: Pr **08.024** is 06.032

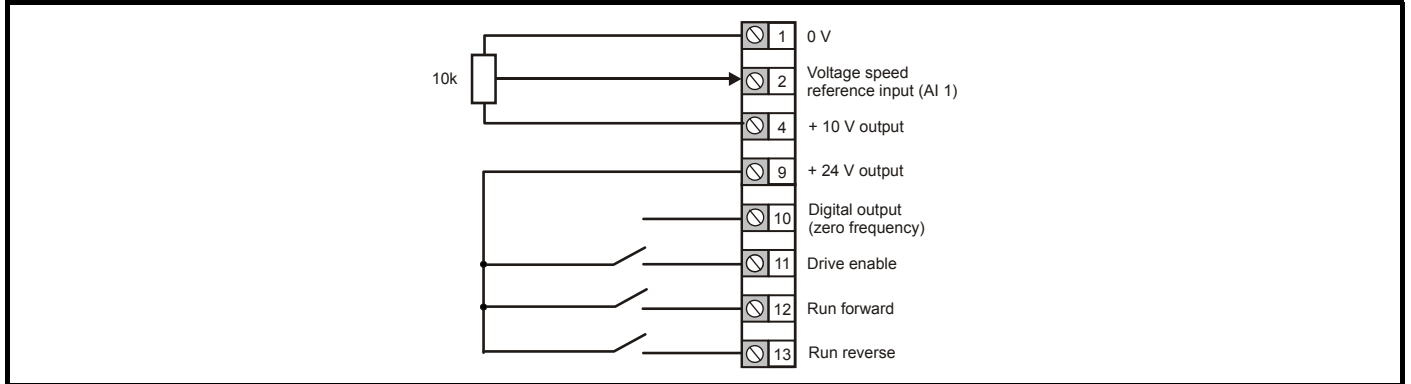

If last default setting was 60 Hz: Pr **08.024** is 06.031.

Value	Text	Description
0	AV	Analog input 1 (voltage)
1	AI	Analog input 1 (current)
2	AV.Pr	Analog input 1 (voltage) or 3 presets selected by terminal
3	AI.Pr	Analog input 1 (current) or 3 presets selected by terminal
4	PrESEt	Four presets selected by terminal
5	PAd	Keypad reference
6	PAd.rEF	Keypad reference with terminal control
8	torquE	Torque mode, Analog input 1 (voltage torque reference) selected by terminal

This parameter is used to automatically setup the user programmable area in the advanced parameter set according to drive configurations. Other default values may also be changed by drive configuration. Parameters are stored in EEPROM automatically following a configuration change. Defaults loaded are defined by *Defaults Previously Loaded*.

Action will only occur if the drive is inactive and no User Actions are running. Otherwise, the parameter will return to its pre altered value on exit from edit mode. All parameters are saved if this parameter changes.

## 7 Running the motor

This chapter takes the new user through all the essential steps to running a motor for the first time, in each of the possible operating modes.

For information on tuning the drive for the best performance, see *Chapter 8 Optimization on page 35*.

 <b>WARNING</b>	Ensure that no damage or safety hazard could arise from the motor starting unexpectedly.
--	--

 <b>CAUTION</b>	<p>The values of the motor parameters affect the protection of the motor.</p> <p>The default values in the drive should not be relied upon. It is essential that the correct value is entered in Pr <b>00.006 Motor Rated Current</b>. This affects the thermal protection of the motor.</p>
--	--

 <b>CAUTION</b>	<p>If the drive is started using the keypad it will run to the speed defined by the keypad reference (Pr <b>01.017</b>). This may not be acceptable depending on the application. The user must check in Pr <b>01.017</b> and ensure that the keypad reference has been set to 0.</p>
--	---

 <b>WARNING</b>	<p>If the intended maximum speed affects the safety of the machinery, additional independent over-speed protection must be used.</p>
--	--

### 7.1 Quick start connections

#### 7.1.1 Basic requirements

This section shows the basic connections which must be made for the drive to run in the required mode. For minimal parameter settings to run in each mode please see the relevant part of section 7.2 *Quick start commissioning / start-up* on page 34.

**Table 7-1 Minimum control connection requirements for each control mode**

Drive control method	Requirements
Terminal mode	Drive enable Speed / Torque reference Run forward / Run reverse
Keypad mode	Drive enable

**Figure 7-1 Minimum connections to get the motor running in any operating mode**

The display will flash 'tuning' while the drive is performing the autotune.</li> <li>Wait for the drive to display 'inh' and for the motor to come to a standstill.</li> </ul> If the drive trips, see Chapter 11 <i>Diagnostics</i> on page 80. <ul style="list-style-type: none"> <li>Remove the drive enable and run signal from the drive.</li> </ul>																																									
Save parameters	Select 'Save' in Pr <b>mm.000</b> (alternatively enter a value of 1001 in Pr <b>mm.000</b> ) and press the red  reset button.																																									
Run	Drive is now ready to run																																									

## 8 Optimization

This chapter takes the user through methods of optimizing the drive set-up and maximize the performance. The auto-tuning features of the drive simplify the optimization tasks.

### 8.1 Motor map parameters

#### 8.1.1 Open loop motor control

<b>Pr 00.006 {05.007} Motor Rated Current</b>	<b>Defines the maximum continuous motor current</b>
<ul style="list-style-type: none"> <li>The rated current parameter must be set to the maximum continuous current of the motor. The motor rated current is used in the following:</li> <li>Current limits (see section section 8.3 <i>Current limits</i> on page 38, for more information)</li> <li>Motor thermal overload protection (see section section 8.4 <i>Motor thermal protection</i> on page 38, for more information)</li> <li>Vector mode voltage control (see <i>Control Mode</i> later in this table)</li> <li>Slip compensation (see <i>Enable Slip Compensation</i> (05.027), later in this table)</li> <li>Dynamic V/F control</li> </ul>	
<b>Pr 00.008 {05.009} Motor Rated Voltage</b>	<b>Defines the voltage applied to the motor at rated frequency</b>
<b>Pr 00.039 {05.006} Motor Rated Frequency</b>	<b>Defines the frequency at which rated voltage is applied</b>
<p>The <i>Motor Rated Voltage</i> (00.008) and the <i>Motor Rated Frequency</i> (00.039) are used to define the voltage to frequency characteristic applied to the motor (see <i>Control Mode</i>, later in this table). The <i>Motor Rated Frequency</i> is also used in conjunction with the motor rated speed to calculate the rated slip for slip compensation (see <i>Motor Rated Speed</i>, later in this table).</p>	
<p>The graph shows a linear relationship between output voltage and output frequency. The y-axis is labeled 'Output voltage' and the x-axis is labeled 'Output frequency'. A solid line starts at the origin (0,0) and rises linearly to a point where the voltage is Pr 00.008 and the frequency is Pr 00.039. From this point, the line becomes horizontal, indicating constant voltage for frequencies above Pr 00.039. Dashed lines indicate the coordinates of the point (Pr 00.039, Pr 00.008) and a point on the linear portion at (Pr 00.039 / 2, Pr 00.008 / 2).</p>	
<b>Pr 00.007 {05.008} Motor Rated Speed</b>	<b>Defines the full load rated speed of the motor</b>
<b>Pr 00.040 {05.011} Number of Motor Poles</b>	<b>Defines the number of motor poles</b>
<p>The motor rated speed and the number of poles are used with the motor rated frequency to calculate the rated slip of induction machines in Hz.</p> $\text{Rated slip (Hz)} = \text{Motor rated frequency} - (\text{Number of pole pairs} \times [\text{Motor rated speed} / 60]) = 00.039 = \left( \frac{00.040}{2} \times \frac{00.007}{60} \right)$ <p>If Pr 00.007 is set to 0 or to synchronous speed, slip compensation is disabled. If slip compensation is required this parameter should be set to the nameplate value, which should give the correct rpm for a hot machine. Sometimes it will be necessary to adjust this when the drive is commissioned because the nameplate value may be inaccurate. Slip compensation will operate correctly both below base speed and within the field-weakening region. Slip compensation is normally used to correct for the motor speed to prevent speed variation with load. The rated load rpm can be set higher than synchronous speed to deliberately introduce speed droop. This can be useful to aid load sharing with mechanically coupled motors.</p> <p>Pr 00.040 is also used in the calculation of the motor speed display by the drive for a given output frequency. When Pr 00.040 is set to 'Auto', the number of motor poles is automatically calculated from the rated frequency Pr 00.039, and the motor rated speed Pr 00.007.</p> $\text{Number of poles} = 120 \times (\text{Rated Frequency} (00.039) / \text{Rated Speed} (00.007)) \text{ rounded to the nearest even number.}$	
<b>Pr 00.043 {05.010} Motor Rated Power Factor</b>	<b>Defines the angle between the motor voltage and current</b>
<p>The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current. The power factor is used in conjunction with the <i>Motor Rated Current</i> (00.006), to calculate the rated active current and magnetising current of the motor. The rated active current is used extensively to control the drive, and the magnetising current is used in vector mode stator resistance compensation. It is important that this parameter is set up correctly. The drive can measure the motor rated power factor by performing a rotating autotune (see <i>Autotune</i> (Pr 00.038), below).</p>	

### Pr 00.038 {05.012} Autotune

There are two autotune tests available in open loop mode, a stationary and a rotating test. A rotating autotune should be used whenever possible so the measured value of power factor of the motor is used by the drive.

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary test measures the *Stator Resistance* (05.017), *Transient Inductance* (05.024), *Maximum Deadtime Compensation* (05.059) and *Current At Maximum Deadtime Compensation* (05.060) which are required for good performance in vector control modes (see *Control Mode* later in this table). The stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr **00.009**. To perform a Stationary autotune, set Pr **00.038** to 1, and provide the drive with both an enable signal (on terminal 11) and a run signal (on terminals 12 or 13).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune, as above, then a rotating test is performed in which the motor is accelerated with currently selected ramps up to a frequency of *Motor Rated Frequency* (00.039) x 2/3, and the frequency is maintained at that level for 4 seconds. *Stator Inductance* (05.025) is measured and this value is used in conjunction with other motor parameters to calculate *Motor Rated Power Factor* (00.009). To perform a Rotating autotune, set Pr **00.038** to 2, and provide the drive with both an enable signal (on terminal 11) and a run signal (on terminals 12 or 13).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the signal from terminal 11, setting the *Drive Enable* (06.015) to OFF (0).

### Pr 00.041 {05.014} Control Mode

There are several voltage modes available which fall into two categories, vector control and fixed boost.

#### Vector control

Vector control mode provides the motor with a linear voltage characteristic from 0 Hz to *Motor Rated Frequency*, and then a constant voltage above motor rated frequency. When the drive operates between motor rated frequency/50 and motor rated frequency/4, full vector based stator resistance compensation is applied. When the drive operates between motor rated frequency/4 and motor rated frequency/2 the stator resistance compensation is gradually reduced to zero as the frequency increases. For the vector modes to operate correctly the *Motor Rated Power Factor* (00.009), *Stator Resistance* (05.017), *Maximum Deadtime Compensation* (05.059) and current at *Maximum Deadtime Compensation* (05.060) are all required to be set up accurately. The drive can be made to measure these by performing an autotune (see Pr **00.038 Autotune**). The drive can also be made to measure the stator resistance automatically every time the drive is enabled or the first time the drive is enabled after it is powered up, by selecting one of the vector control voltage modes.

(0) **Ur S** = The stator resistance is measured and the parameters for the selected motor map are over-written each time the drive is made to run. This test can only be done with a stationary motor where the flux has decayed to zero. Therefore this mode should only be used if the motor is guaranteed to be stationary each time the drive is made to run. To prevent the test from being done before the flux has decayed there is a period of 1 second after the drive has been in the ready state during which the test is not done if the drive is made to run again. In this case, previously measured values are used. Ur S mode ensures that the drive compensates for any change in motor parameters due to changes in temperature. The new value of stator resistance is not automatically saved to the drive's EEPROM.

(4) **Ur I** = The stator resistance is measured when the drive is first made to run after each power-up. This test can only be done with a stationary motor. Therefore this mode should only be used if the motor is guaranteed to be stationary the first time the drive is made to run after each power-up. The new value of stator resistance is not automatically saved to the drive's EEPROM.

(1) **Ur** = The stator resistance and voltage offset are not measured. The user can enter the motor and cabling resistance into the *Stator Resistance* (05.017). However this will not include resistance effects within the drive inverter. Therefore if this mode is to be used, it is best to use an autotune test initially to measure the stator resistance.

(3) **Ur\_Auto** = The stator resistance is measured once, the first time the drive is made to run. After the test has been completed successfully the *Control Mode* (00.041) is changed to Ur mode. The *Stator Resistance* (05.017) parameter is written to, and along with the *Control Mode* (00.041), are saved in the drive's EEPROM. If the test fails, the voltage mode will stay set to Ur Auto and the test will be repeated next time the drive is made to run.

#### Fixed boost

The stator resistance is not used in the control of the motor, instead a fixed characteristic with low frequency voltage boost as defined by Pr **00.042**, is used. Fixed boost mode should be used when the drive is controlling multiple motors. There are three settings of fixed boost available:

(2) **Fixed** = This mode provides the motor with a linear voltage characteristic from 0 Hz to *Motor Rated Frequency* (00.039), and then a constant voltage above rated frequency.

(5) **Square** = This mode provides the motor with a square law voltage characteristic from 0 Hz to *Motor Rated Frequency* (00.039), and then a constant voltage above rated frequency. This mode is suitable for variable torque applications like fans and pumps where the load is proportional to the square of the speed of the motor shaft. This mode should not be used if a high starting torque is required.

(6) **Fixed Tapered** = This mode provides the motor with a linear voltage characteristic with a tapered slip limit.

### Pr 00.041 {05.014} Control Mode (cont)

For mode 2 and 5, at low frequencies (from 0 Hz to  $\frac{1}{2}$  x Pr 00.039) a voltage boost is applied as defined by Pr 00.042 as shown below:

### Pr 05.027 Enable Slip Compensation

When a motor, being controlled in open loop mode, has load applied a characteristic of the motor is that the output speed droops in proportion to the load applied as shown:

In order to prevent the speed droop shown above slip compensation should be enabled. To enable slip compensation Pr 05.027 must be set to a 100 % (this is the default setting), and the motor rated speed must be entered in Pr 00.007 (Pr 05.008).

The motor rated speed parameter should be set to the synchronous speed of the motor minus the slip speed. This is normally displayed on the motor nameplate, i.e. for a typical 18.5 kW, 50 Hz, 4 pole motor, the motor rated speed would be approximately 1465 rpm. The synchronous speed for a 50 Hz, 4 pole motor is 1500 rpm, so therefore the slip speed would be 35 rpm. If the synchronous speed is entered in Pr 00.007, slip compensation will be disabled. If too small a value is entered in Pr 00.007, the motor will run faster than the demanded frequency. The synchronous speeds for 50 Hz motors with different numbers of poles are as follows:

2 pole = 3000 rpm, 4 pole = 1500 rpm, 6pole =1000 rpm, 8 pole = 750 rpm

## 8.2 Maximum motor rated current

The maximum motor rated current is the *Maximum Heavy Duty Current Rating* (00.077).

The values for the Heavy Duty rating can be found in the *Power Installation Guide*.

## 8.3 Current limits

The default setting for the current limit parameters for size 1 to 4 is:

- 165 % x motor rated torque producing current for open loop mode

There are three parameters which control the current limits:

- Motoring current limit: power flowing from the drive to the motor
- Regen current limit: power flowing from the motor to the drive
- Symmetrical current limit: current limit for both motoring and regen operation

The lowest of either the motoring and regen current limit, or the symmetrical current limit applies.

The maximum setting of these parameters depends on the values of motor rated current, drive rated current and the power factor.

The drive can be oversized to permit a higher current limit setting to provide higher accelerating torque as required up to a maximum of 1000 %.

## 8.4 Motor thermal protection

A time constant thermal model is provided to estimate the motor temperature as a percentage of its maximum allowed temperature.

The motor thermal protection is modelled using losses in the motor. The losses in the motor are calculated as a percentage value, so that under these conditions the *Motor Protection Accumulator* (04.019) would eventually reach 100 %.

$$\text{Percentage losses} = 100 \% \times [\text{Load related losses}]$$

Where:

$$\text{Load related losses} = [I / (K_1 \times I_{\text{Rated}})]^2$$

Where:

$$I = \text{Current Magnitude (04.001)}$$

$$I_{\text{Rated}} = \text{Motor Rated Current (00.006)}$$

If *Motor Rated Current* (00.006)  $\leq$  *Maximum Heavy Duty Current* (00.077)

**Figure 8-1 Motor thermal protection (Heavy Duty)**

If Pr **04.025** is 0 the characteristic is for a motor which can operate at rated current over the whole speed range. Induction motors with this type of characteristic normally have forced cooling. If Pr **04.025** is 1 the characteristic is intended for motors where the cooling effect of motor fan reduces with reduced motor speed below 50 % of base speed/frequency. The maximum value for K1 is 1.05, so that above the knee of the characteristics the motor can operate continuously up to 105 % current.

When the estimated temperature in Pr **04.019** reaches 100 % the drive takes some action depending on the setting of Pr **04.016**. If Pr **04.016** is 0, the drive trips when Pr **04.019** reaches 100 %. If Pr **04.016** is 1, the current limit is reduced to  $(K - 0.05) \times 100 \%$  when Pr **04.019** reaches 100 %.

The current limit is set back to the user defined level when Pr **04.019** falls below 95 %. The thermal model temperature accumulator accumulates the temperature of the motor while the drive remains powered-up. By default, the accumulator is set to the power down value at power up. If the rated current defined by Pr **00.006** is altered, the accumulator is reset to zero.

The default setting of the thermal time constant (Pr **04.015**) is 179 s which is equivalent to an overload of 150 % for 120 s from cold.

## 8.5 Switching frequency

The default switching frequency is 3 kHz, however this can be increased up to a maximum of 16 kHz by Pr **00.037**.

If switching frequency is increased from 3 kHz the following apply:

1. Increased heat loss in the drive, which means that derating to the output current must be applied.  
See the derating tables for switching frequency and ambient temperature in the *Power Installation Guide*.
2. Reduced heating of the motor - due to improved output waveform quality.
3. Reduced acoustic noise generated by the motor.
4. Increased sample rate on the speed and current controllers. A trade off must be made between motor heating, drive heating and the demands of the application with respect to the sample time required.

**Table 8-1 Sample rates for various control tasks at each switching frequency**

	0.667, 1 kHz	3, 6, 12 kHz	2, 4, 8, 16 kHz	Open loop
Level 1	250 $\mu$ s	167 $\mu$ s	2 kHz = 250 $\mu$ s 4 kHz = 125 $\mu$ s 8 kHz = 125 $\mu$ s 16 kHz = 125 $\mu$ s	Peak limit
Level 2	250 $\mu$ s			Current limit and ramps
Level 3	1 ms			Voltage controller
Level 4	4 ms			Time critical user interface
Background				Non-time critical user interface

### 8.5.1 Field weakening (constant power) operation

The drive can be used to run an induction machine above synchronous speed into the constant power region. The speed continues to increase and the available shaft torque reduces. The characteristics below show the torque and output voltage characteristics as the speed is increased above the rated value.

**Figure 8-2 Torque and rated voltage against speed**

Care must be taken to ensure the torque available above base speed is sufficient for the application to run satisfactorily.

### 8.5.2 Maximum frequency

In all operating modes the maximum output frequency is limited to 550 Hz.

### 8.5.3 Over-modulation

The maximum output voltage level of the drive is normally limited to an equivalent of the drive input voltage minus voltage drops within the drive (the drive will also retain a few percent of the voltage in order to maintain current control). If the motor rated voltage is set at the same level as the supply voltage, some pulse deletion will occur as the drive output voltage approaches the rated voltage level. If Pr **05.020** (Over-modulation enable) is set to 1 the modulator will allow over modulation, so that as the output frequency increases beyond the rated frequency the voltage continues to increase above the rated voltage.

This can be used for example:

- To obtain high output frequencies with a low switching frequency which would not be possible with space vector modulation limited to unity modulation depth,

or

- In order to maintain a higher output voltage with a low supply voltage.

The disadvantage is that the machine current will be distorted as the modulation depth increases above unity, and will contain a significant amount of low order odd harmonics of the fundamental output frequency. The additional low order harmonics cause increased losses and heating in the motor.

### 8.5.4 Switching frequency

With a default switching frequency of 3 kHz, the maximum output frequency should be limited to 250 Hz. Ideally, a minimum ratio of 12:1 should be maintained between the switching frequency and the output frequency. This ensures the number of switchings per cycle is sufficient to ensure the output waveform quality is maintained at a minimum level.

## 9 NV Media Card

### 9.1 Introduction

The Non-Volatile Media Card feature enables simple configuration of parameters, parameter back-up and drive cloning using an SD card.

The SD card can be used for:

- Parameter copying between drives
- Saving drive parameter sets

The NV Media Card (SD card) is located in the AI-Backup Adaptor.

The card is not hot swappable, but the AI-Backup Adaptor is “hot swapped” only when the five unit LEDs on the display are not flashing.

The unit LEDs flash during the data transfer.

**Figure 9-1 Installation of the SD card**

1. Installing the SD card

#### NOTE

A flat bladed screwdriver or similar tool is required in order to insert/ remove the SD card fully into/ remove from the AI-Backup Adaptor.

To insert/remove the SD card into/from the AI-Backup Adaptor, the AI-Backup Adaptor will need to be removed from the drive.

### 9.2 SD card support

An SD memory card can be inserted in the AI-Backup Adaptor in order to transfer data to the drive, however the following limitations should be noted:

If a parameter from the source drive does not exist in the target drive then no data is transferred for that parameter.

If the data for the parameter in the target drive is out of range then the data is limited to the range of the target parameter.

If the target drive has a different rating to the source drive then the normal rules for this type of transfer apply as described later.

No checking is possible to determine if the source and target product types are the same, and so no warning is given if they are different.

If an SD card is used then the drive will recognise the following file types through the drive parameter interface.

File Type	Description
Parameter file	A file that contains all clonable user save parameters from the drive menus (1 to 22) in difference from default format
Macro file	The same as a parameter file, but defaults are not loaded before the data is transferred from the card

These files can be created on a card by the drive and then transferred to any other drive including derivatives. If the Drive Derivative (11.028) is different between the source and target drives then the data is transferred but a {C.Pr} trip is initiated.

It is possible for other data to be stored on the card, but this should not be stored in the <MCDF> folder and it will not be visible via the drive parameter interface.

#### 9.2.1 Changing the drive mode

If the source drive mode is different from the target drive mode then the mode will be changed to the source drive mode before the parameters are transferred. If the required drive mode is outside the allowed range for the target then a {C.typ} trip is initiated and no data is transferred.

#### 9.2.2 Different voltage ratings

If the voltage rating of the source and target drives is different then all parameters except those that are rating dependent (i.e. attribute RA=1) are transferred to the target drive. The rating dependent parameters are left at their default values. After the parameters have been transferred and saved to non-volatile memory a {C.rtg} trip is given as a warning. The table below gives a list of the rating dependent parameters.

Parameters
Standard Ramp Voltage (02.008)
Motoring Current Limit (04.005)
Regenerating Current Limit (04.006)
Symmetrical Current Limit (04.007)
User Current Maximum Scaling (04.024)
Motor Rated Current (05.007)
Motor Rated Voltage (05.009)
Motor Rated Power Factor (05.010)
Stator Resistance (05.017)
Maximum Switching Frequency (05.018)
Transient Inductance /Ld (05.024)
Stator Inductance (05.025)
Injection Braking Level (06.006)
Supply Loss Detection Level (06.048)

### 9.2.3 Different current ratings

If any of the current rating parameters (Maximum Heavy Duty Rating (00.077), Maximum Rated Current (11.060) or Full Scale Current Kc (11.061)) are different between the source and target then all parameters are still written to the target drive, but some may be limited by their allowed range. To give similar performance in the target compared to the source drive the current controller gains are modified as shown below. Note that this does not apply if the file identification number is larger than 500.

Gains	Multiplier
Current Controller Kp Gain (04.013)	[Source Full Scale Current Kc (11.061)] /
Current Controller Ki Gain (04.014)	[Target Full Scale Current Kc (11.061)]

### 9.2.4 Different variable maximums

It should be noted that if ratings of the source and target drives are different, it is possible that some parameters with variable maximums may be limited and not have the same values as in the source drive.

### 9.2.5 Macro files

Macro files are created in the same way as parameter files except that *NV Media Card Create Special File* (11.072) must be set to 1 before the file is created on the NV media card. *NV Media Card Create Special File* (11.072) is set to zero after the file has been created or the transfer fails. When a macro file is transferred to a drive the drive mode is not changed even if the actual mode is different to that in the file and defaults are not loaded before the parameters are copied from the file to the drive.

**Table 9-1 Functions in Pr mm.000**

Value	Action
2001	Transfer the drive parameters to parameter file 001 and sets the block as bootable.
4yyy	Transfer the drive parameters to parameter file yyy.
6yyy	Load the drive parameters from parameter file yyy
7yyy	Erase file yyy.
8yyy	Compare the data in the drive with the file yyy. The data in the drive is compared to the data in the file yyy. If the files are the same then Pr mm.000 is simply reset to 0 when the compare is complete. If the files are different a {Card Compare} trip is initiated. All other NV media card trips also apply.
9555	Clear the warning suppression flag.
9666	Set the warning suppression flag.
9777	Clear the read-only flag.
9888	Set the read-only flag.

### 9.2.6 Writing to the NV Media Card

#### 4yyy - Writes defaults differences to the NV Media Card

The data block only contains the parameter differences from the last time default settings were loaded.

All parameters except those with the NC (Not copied) coding bit set are transferred to the NV Media Card.

#### Writing a parameter set to the NV Media Card (Pr 00.030 = Prog (2))

Setting Pr 00.030 to Prog (2) and resetting the drive will save the parameters to the NV Media Card, i.e. this is equivalent to writing 4001 to Pr mm.000. All NV Media Card trips apply. If the data block already exists it is automatically overwritten. When the action is complete this parameter is automatically reset to NonE (0).

### 9.2.7 Reading from the NV Media Card

#### 6yyy - Reading from NV Media Card

When the data is transferred back to the drive, using 6yyy in Pr mm.000, it is transferred to the drive RAM and the EEPROM. A parameter save is not required to retain the data after-power down.

If the data is being transferred to the drive with different voltage or current rating a

'C.rtg' trip will occur.

The following drive rating dependant parameters (RA coding bit set) will not be transferred to the destination drive by a NV Media Card when the voltage rating of the destination drive is different from the source drive and the file is a parameter file.

However, drive rating dependent parameters will be transferred if only the current rating is different. If drive rating dependant parameters are not transferred to the destination drive they will contain their default values.

Pr 02.008 Standard Ramp Voltage

Pr 04.005 to Pr 04.007 Motoring Current Limits

Pr 04.024, User Current Maximum Scaling

Pr 04.041 User Over Current Trip Level

Pr 05.007 Rated Current

Pr 05.009 Rated Voltage

Pr 05.010 Rated Power Factor

Pr 05.017 Stator Resistance

Pr 05.018 Maximum Switching Frequency

Pr 05.024 Transient Inductance

Pr 05.025 Stator Inductance

Pr 06.006 Injection Braking Level

Pr 06.048 Supply Loss Detection Level

Pr 06.073 Braking IGBT Lower Threshold

Pr 06.074 Braking IGBT Upper Threshold

Pr 06.075 Low Voltage Braking IGBT Threshold

#### Reading a parameter set from the NV Media Card (Pr 00.030 = rEAd (1))

Setting Pr 00.030 to rEAd (1) and resetting the drive will transfer the parameters from the card into the drive parameter set and the drive EEPROM, i.e. this is equivalent to writing 6001 to Pr mm.000.

All NV Media Card trips apply. Once the parameters are successfully copied this parameter is automatically reset to NonE (0). Parameters are saved to the drive EEPROM after this action is complete.

#### 9.2.8 Auto saving parameter changes (Pr 00.030 = Auto (3))

This setting causes the drive to automatically save any changes made to menu 0 parameters on the drive to the NV Media Card. The latest menu 0 parameter set in the drive is therefore always backed up on the NV Media Card. Changing Pr 00.030 to Auto (3) and resetting the drive will immediately save the complete parameter set from the drive to the card, i.e. all parameters except parameters with the NC coding bit set. Once the whole parameter set is stored only the individual modified menu 0 parameter setting is updated.

Advanced parameter changes are only saved to the NV Media Card when Pr mm.000 is set to 'SAVE' or a 1001 and the drive

reset.

All NV Media Card trips apply. If the data block already contains information it is automatically overwritten.

If the card is removed when Pr **00.030** is set to 3, Pr **00.030** is then automatically set to NonE (0).

When a new NV Media Card is installed Pr **00.030** must be set back to Auto (3) by the user and the drive reset so the complete parameter set is rewritten to the new NV Media Card if auto mode is still required.

When Pr **00.030** is set to Auto (3) and the parameters in the drive are saved, the NV Media Card is also updated, and therefore the NV Media Card becomes a copy of the drives stored configuration.

At power up, if Pr **00.030** is set to Auto (3), the drive will save the complete parameter set to the NV Media Card. The 5 unit LEDs will flash during this operation. This is done to ensure that if a user puts a new NV Media Card in during power down the new NV Media Card will have the correct data.

#### NOTE

When Pr **00.030** is set to Auto (3) the setting of Pr **00.030** itself is saved to the drive EEPROM but not the NV Media Card.

### 9.2.9 Booting up from the NV Media Card on every power up (Pr **00.030** = boot (4))

When Pr **00.030** is set to boot (4) the drive operates the same as Auto mode except when the drive is powered-up. The parameters on the NV Media Card will be automatically transferred to the drive at power up if the following are true:

- A card is inserted in the drive
- Parameter data block 1 exists on the card
- The data in block 1 is type 1 to 4 (as defined in Pr **11.038**)
- Pr **00.030** on the card set to boot (4)

The 5 unit LEDs will flash during this operation. If the drive mode is different from that on the card, the drive gives a 'C.tyP' trip and the data is not transferred.

If 'boot' mode is stored on the copying NV Media Card this makes the copying NV Media Card the master device. This provides a very fast and efficient way of re-programming a number of drives.

'boot' mode is saved to the card, but when the card is read, the value of Pr **00.030** is not transferred to the drive.

### 9.2.10 Booting up from the NV Media Card on every power up (Pr **mm.000** = 2001)

It is possible to create a bootable parameter data block by setting Pr **mm.000** to 2001 and initiating a drive reset. This data block is created in one operation and is not updated when further parameter changes are made.

Setting Pr **mm.000** to 2001 will overwrite the data block 1 on the card if it already exists.

### 9.2.11 8yyy - Comparing the drive full parameter set with the NV Media Card values

Setting 8yyy in Pr **mm.000**, will compare the NV Media Card file with the data in the drive. If the compare is successful Pr **mm.000** is simply set to 0. If the compare fails a 'C.cPr' trip is initiated.

### 9.2.12 7yyy - Erasing data from the NV Media Card values

Data can be erased from the NV Media Card either one block at a time or all blocks in one go.

- Setting 7yyy in Pr **mm.000** will erase NV Media Card data block yyy

### 9.2.13 9666 / 9555 - Setting and clearing the NV Media Card warning suppression flag

If the data is being transferred to a drive of a different voltage or current rating a 'C.rtg' trip will occur. It is possible to suppress these trips by setting the warning suppression flag. If this flag is set the drive will not trip if the drive ratings are different between the source and destination drives.

The rating dependent parameters will not be transferred.

- Setting 9666 in Pr **mm.000** will set the warning suppression flag
- Setting 9555 in Pr **mm.000** will clear the warning suppression flag

### 9.2.14 9888 / 9777 - Setting and clearing the NV Media Card read only flag

The NV Media Card may be protected from writing or erasing by setting the read only flag. If an attempt is made to write or erase a data block when the read only flag is set, a 'C.rdo' trip is initiated. When the read only flag is set only codes 6yyy or 9777 are effective.

- Setting 9888 in Pr **mm.000** will set the read only flag
- Setting 9777 in Pr **mm.000** will clear the read only flag

## 9.3 NV Media Card parameters

Table 9-2 Key to parameter table coding

RW	Read / Write	ND	No default value
RO	Read only	NC	Not copied
Num	Number parameter	PT	Protected parameter
Bit	Bit parameter	RA	Rating dependant
Txt	Text string	US	User save
Bin	Binary parameter	PS	Power-down save
Fl	Filtered	DE	Destination

11.036		NV Media Card File Previously Loaded			
RO	Num	NC	PT		
⇕	0 to 999		⇒		0

This parameter shows the number of the data block last transferred from an SD card to the drive. If defaults are subsequently reloaded this parameter is set to 0.

11.037		NV Media Card File Number			
RW	Num				
⇕	0 to 999		⇒		0

This parameter should have the data block number which the user would like the information displayed in Pr **11.038**, Pr **11.039**.

11.038		NV Media Card File Type				
RO	Txt	ND	NC	PT		
⇅		0 to 1		⇒		0

Displays the type/mode of the data block selected with Pr 11.037.

Pr 11.038	String	Type / mode
0	None	No file selected
1	Open-loop	Open-Loop mode parameter file

11.039		NV Media Card File Version				
RO	Num	ND	NC	PT		
⇅		0 to 9999		⇒		0

Displays the version number of the file selected in Pr 11.037.

11.042 {00.030}		Parameter Cloning				
RW	Txt		NC			US
⇅	NonE (0), rEAd (1), Prog (2), Auto (3), boot (4)			⇒		0

## 9.4 NV Media Card trips

After an attempt to read, write or erase data from a NV Media Card a trip is initiated if there has been a problem with the command.

See Chapter 11 *Diagnostics* on page 80 for more information on NV Media Card trips.

## 9.5 Data block header information

Each data block stored on a NV Media Card has header information detailing the following:

- NV Media Card File Number (11.037)
- NV Media Card File Type (11.038)
- NV Media Card File Version (11.039)

The header information for each data block which has been used can be viewed in Pr 11.038 to Pr 11.039 by increasing or decreasing the data block number set in Pr 11.037. If there is no data on the card Pr 11.037 can only have a value of 0.

## 10 Advanced parameters

Full descriptions of the parameters can be found in the *Parameter Reference Guide*.

**These advanced parameters are listed for reference purposes only. The lists in this chapter do not include sufficient information for adjusting these parameters. Incorrect adjustment can affect the safety of the system, and damage the drive and or external equipment. Before attempting to adjust any of these parameters, refer to the *Parameter reference guide*.**

**Table 10-1 Menu descriptions**

Menu	Description
0	Commonly used basic set up parameters for quick / easy programming
1	Frequency reference
2	Ramps
3	Frequency control
4	Torque and current control
5	Motor control
6	Sequencer and clock
7	Analog I/O
8	Digital I/O
10	Status and trips
11	Drive set-up and identification
22	Menu 0 set-up

### Operation mode abbreviations:

**Open-loop:** Sensorless control for induction motors

### Default abbreviations:

Standard default value (50 Hz AC supply frequency)

USA default value (60 Hz AC supply frequency)

### NOTE

Parameter numbers shown in brackets {...} are the equivalent Menu 0 parameters. Some Menu 0 parameters appear twice since their function depends on the operating mode.

In some cases, the function or range of a parameter is affected by the setting of another parameter. The information in the lists relates to the default condition of any parameters affected in this way.

**Table 10-2 Key to parameter table coding**

Coding	Attribute
<b>RW</b>	Read/Write: can be written by the user
<b>RO</b>	Read only: can only be read by the user
<b>Bit</b>	1 bit parameter. 'On' or 'Off' on the display
<b>Num</b>	Number: can be uni-polar or bi-polar
<b>Txt</b>	Text: the parameter uses text strings instead of numbers.
<b>Bin</b>	Binary parameter
<b>Date</b>	Date parameter
<b>Time</b>	Time parameter
<b>FI</b>	Filtered: some parameters which can have rapidly changing values are filtered when displayed on the drive keypad for easy viewing.
<b>DE</b>	Destination: This parameter selects the destination of an input or logic function.
<b>RA</b>	Rating dependent: this parameter is likely to have different values and ranges with drives of different voltage and current ratings. Parameters with this attribute will be transferred to the destination drive by non-volatile storage media when the rating of the destination drive is different from the source drive and the file is a parameter file. However, the values will be transferred if only the current rating is different and the file is a difference from default type file.
<b>ND</b>	No default: The parameter is not modified when defaults are loaded
<b>NC</b>	Not copied: not transferred to or from non-volatile media during copying.
<b>PT</b>	Protected: cannot be used as a destination.
<b>US</b>	User save: parameter saved in drive EEPROM when the user initiates a parameter save.
<b>PS</b>	Power-down save: parameter automatically saved in drive EEPROM when the under volts (UV) trip occurs.

## 10.1 Parameter ranges and Variable minimum/maximums:

Some parameters in the drive have a variable range with a variable minimum and a variable maximum values which is dependent on one of the following:

- The settings of other parameters
- The drive rating
- The drive mode
- Combination of any of the above

The tables below give the definition of variable minimum/maximum and the maximum range of these.

<b>VM_AC_VOLTAGE</b>		Range applied to parameters showing AC voltage
<b>Units</b>	V	
<b>Range of [MIN]</b>	0	
<b>Range of [MAX]</b>	0 to 930	
<b>Definition</b>	VM_AC_VOLTAGE[MAX] is drive voltage rating dependent. See Table 10-4 VM_AC_VOLTAGE[MIN] = 0	

<b>VM_AC_VOLTAGE_SET</b>		Range applied to the AC voltage set-up parameters
<b>Units</b>	V	
<b>Range of [MIN]</b>	0	
<b>Range of [MAX]</b>	0 to 765	
<b>Definition</b>	VM_AC_VOLTAGE_SET[MAX] is drive voltage rating dependent. See Table 10-4 VM_AC_VOLTAGE_SET[MIN] = 0	

<b>VM_ACCEL_RATE</b>		Maximum applied to the ramp rate parameters
<b>Units</b>	s / 100 Hz, s/1000 Hz, s/Max Frequency	
<b>Range of [MIN]</b>	Open-loop: 0.0	
<b>Range of [MAX]</b>	Open-loop: 0.0 to 3200.0	
<b>Definition</b>	<p>A maximum needs to be applied to the ramp rate parameters because the units are a time for a change of speed from zero to a defined level or to maximum speed. If the change of speed is to the maximum speed then changing the maximum speed changes the actual ramp rate for a given ramp rate parameter value. The variable maximum calculation ensures that longest ramp rate (parameter at its maximum value) is not slower than the rate with the defined level, i.e. 3200.0 s/100 Hz.</p> <p>The maximum frequency is taken from <i>Maximum Reference Clamp</i> (01.006)</p> <p>VM_ACCEL_RATE[MIN] = 0.0</p> <p>If Ramp Rate Units (02.039) = 0: VM_ACCEL_RATE[MAX] = 3200.0</p> <p>Otherwise: VM_ACCEL_RATE[MAX] = 3200.0 x Maximum frequency / 100.00</p>	

<b>VM_DC_VOLTAGE</b>		Range applied to DC voltage reference parameters
<b>Units</b>	V	
<b>Range of [MIN]</b>	0	
<b>Range of [MAX]</b>	0 to 1190	
<b>Definition</b>	VM_DC_VOLTAGE[MAX] is the full scale DC link voltage feedback (over voltage trip level) for the drive. This level is drive voltage rating dependent. See Table 10-4 VM_DC_VOLTAGE[MIN] = 0	

<b>VM_DC_VOLTAGE_SET</b>		Range applied to DC voltage reference parameters
<b>Units</b>	V	
<b>Range of [MIN]</b>	0	
<b>Range of [MAX]</b>	0 to 1150	
<b>Definition</b>	VM_DC_VOLTAGE_SET[MAX] is drive voltage rating dependent. See Table 10-4 VM_DC_VOLTAGE_SET[MIN] = 0	

<b>VM_DRIVE_CURRENT</b>		Range applied to parameters showing current in A
<b>Units</b>	A	
<b>Range of [MIN]</b>	-9999.99 to 0.00	
<b>Range of [MAX]</b>	0.00 to 9999.99	
<b>Definition</b>	VM_DRIVE_CURRENT[MAX] is equivalent to the full scale (over current trip level) for the drive and is given by <i>Full Scale Current Kc</i> (11.061). VM_DRIVE_CURRENT[MIN] = - VM_DRIVE_CURRENT[MAX]	

<b>VM_FREQ</b>		Range applied to parameters showing frequency
<b>Units</b>	Hz	
<b>Range of [MIN]</b>	-1100.00	
<b>Range of [MAX]</b>	1100.00	
<b>Definition</b>	This variable minimum/maximum defines the range of speed monitoring parameters. To allow headroom for overshoot the range is set to twice the range of the speed references. VM_FREQ[MIN] = 2 x VM_SPEED_FREQ_REF[MIN] VM_FREQ[MAX] = 2 x VM_SPEED_FREQ_REF[MAX]	

<b>VM_MAX_SWITCHING_FREQUENCY</b>		Range applied to the maximum switching frequency parameters
<b>Units</b>	User units	
<b>Range of [MIN]</b>	Open-loop: 0 (0.667 kHz)	
<b>Range of [MAX]</b>	Open-loop: 8 (16kHz)	
<b>Definition</b>	VM_SWITCHING_FREQUENCY[MAX] = Power stage dependent VM_SWITCHING_FREQUENCY[MIN] = 0 This variable maximum is used by the <i>Minimum Switching Frequency</i> (05.038) to define the minimum frequency limit used if the inverter thermal model is actively reducing the switching frequency due to temperature. Note that parameter <i>Maximum Switching Frequency</i> (05.018) takes priority over parameter <i>Minimum Switching Frequency</i> (05.038) so is not limited by parameter <i>Minimum Switching Frequency</i> (05.038). The actual minimum switching frequency limit used is the lower of <i>Maximum Switching Frequency</i> (05.018) and <i>Minimum Switching Frequency</i> (05.038).	

<b>VM_MOTOR1_CURRENT_LIMIT</b>		Range applied to current limit parameters (motor 1)
<b>Units</b>	%	
<b>Range of [MIN]</b>	0.0	
<b>Range of [MAX]</b>	0.0 to 1000.0	
<b>Definition</b>	<p>VM_MOTOR1_CURRENT_LIMIT[MAX] is dependent on the drive rating and motor set-up parameters.  VM_MOTOR1_CURRENT_LIMIT[MIN] = 0.0</p> <p><b>Open-loop</b>  VM_MOTOR1_CURRENT_LIMIT[MAX] = <math>(I_{Tlimit} / I_{Trated}) \times 100 \%</math></p> <p>Where:</p> $I_{Tlimit} = I_{MaxRef} \times \cos(\sin^{-1}(I_{Mrated} / I_{MaxRef}))$ $I_{Mrated} = Pr \text{ 05.007} \sin \phi$ $I_{Trated} = Pr \text{ 05.007} \times \cos \phi$ $\cos \phi = Pr \text{ 05.010}$ <p><math>I_{MaxRef}</math> is 0.7 x Pr <b>11.061</b> when the motor rated current set in Pr <b>05.007</b> is less than or equal to Pr <b>11.032</b> (i.e. Heavy duty).</p> $MOTOR1\_CURRENT\_LIMIT\_MAX = \frac{\sqrt{\left[ \frac{\text{Maximum current}}{\text{Motor rated current}} \right]^2 + (PF)^2 - 1}}{PF} \times 100\%$ <p>Where:</p> <p>Motor rated current is given by Pr <b>05.007</b>  PF is motor rated power factor given by Pr <b>05.010</b>  The Maximum current is (1.5 x Rated drive current) when the rated current set by Pr <b>05.007</b> is less than or equal to the Maximum Heavy Duty current rating specified in Pr <b>11.032</b>.</p> <p>For example, with a motor of the same rating as the drive and a power factor of 0.85, the maximum current limit is 165.2%.</p> <p>The rated active and rated magnetising currents are calculated from the power factor (Pr <b>05.010</b>) and motor rated current (Pr <b>05.007</b>) as:</p> <p>rated active current = power factor x motor rated current  rated magnetising current = <math>\sqrt{(1 - \text{power factor}^2)} \times \text{motor rated current}</math></p>	

<b>VM_NEGATIVE_REF_CLAMP1</b>		Limits applied to the negative frequency clamp (motor 1)																		
<b>Units</b>	Hz																			
<b>Range of [MIN]</b>	-550.00 to 0.00																			
<b>Range of [MAX]</b>	0.00 to 550.00																			
<b>Definition</b>	<p>This variable maximum/minimum defines the range of the negative frequency clamp associated with motor map 1 (<i>Minimum Reference Clamp</i> (01.007)). The minimum and maximum are affected by the settings of the <i>Negative Reference Clamp Enable</i> (01.008), <i>Bipolar Reference Enable</i> (01.010) and <i>Maximum Reference Clamp</i> (01.006) as shown in the table below.</p> <table border="1"> <thead> <tr> <th><i>Negative Reference Clamp Enable</i> (01.008)</th> <th><i>Bipolar Reference Enable</i> (01.010)</th> <th>VM_NEGATIVE_REF_CLAMP1[MIN]</th> <th>VM_NEGATIVE_REF_CLAMP1[MAX]</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0.00</td> <td>Pr <b>01.006</b></td> </tr> <tr> <td>0</td> <td>1</td> <td>0.00</td> <td>0.00</td> </tr> <tr> <td>1</td> <td>X</td> <td>VM_POSITIVE_REF_CLAMP1[MAX]</td> <td>0.00</td> </tr> </tbody> </table>				<i>Negative Reference Clamp Enable</i> (01.008)	<i>Bipolar Reference Enable</i> (01.010)	VM_NEGATIVE_REF_CLAMP1[MIN]	VM_NEGATIVE_REF_CLAMP1[MAX]	0	0	0.00	Pr <b>01.006</b>	0	1	0.00	0.00	1	X	VM_POSITIVE_REF_CLAMP1[MAX]	0.00
<i>Negative Reference Clamp Enable</i> (01.008)	<i>Bipolar Reference Enable</i> (01.010)	VM_NEGATIVE_REF_CLAMP1[MIN]	VM_NEGATIVE_REF_CLAMP1[MAX]																	
0	0	0.00	Pr <b>01.006</b>																	
0	1	0.00	0.00																	
1	X	VM_POSITIVE_REF_CLAMP1[MAX]	0.00																	

<b>VM_POSITIVE_REF_CLAMP</b>		Limits applied to the positive frequency reference clamp
<b>Units</b>	Hz	
<b>Range of [MIN]</b>	0.00	
<b>Range of [MAX]</b>	550.00	
<b>Definition</b>	VM_POSITIVE_REF_CLAMP[MAX] defines the range of the positive reference clamp, <i>Maximum Reference Clamp</i> (01.006), which in turn limit the references.	

<b>VM_POWER</b>		Range applied to parameters that either set or display power
Units	kW	
Range of [MIN]	-9999.99 to 0.00	
Range of [MAX]	0.00 to 9999.99	
Definition	VM_POWER[MAX] is rating dependent and is chosen to allow for the maximum power that can be output by the drive with maximum AC output voltage, at maximum controlled current and unity power factor. $VM\_POWER[MAX] = \sqrt{3} \times VM\_AC\_VOLTAGE[MAX] \times VM\_DRIVE\_CURRENT[MAX] / 1000$ $VM\_POWER[MIN] = -VM\_POWER[MAX]$	

<b>VM_RATED_CURRENT</b>		Range applied to rated current parameters
Units	A	
Range of [MIN]	0.00	
Range of [MAX]	0.00 to 9999.99	
Definition	VM_RATED_CURRENT [MAX] = <i>Maximum Rated Current</i> (11.060) and is dependent on the drive rating. VM_RATED_CURRENT [MIN] = 0.00	

<b>VM_SPEED_FREQ_REF</b>		Range applied to the frequency reference parameters
Units	Hz	
Range of [MIN]	-550.00 to 0.00	
Range of [MAX]	0.00 to 550.00	
Definition	This variable minimum/maximum is applied throughout the frequency and speed reference system so that the references can vary in the range from the minimum to maximum clamps.	
	<b>Negative Reference Clamp Enable (01.008)</b>	<b>VM_SPEED_FREQ_REF[MAX]</b>
	0	<i>Maximum Reference Clamp</i> (01.006)
	1	<i>Maximum Reference Clamp</i> (01.006) or <i>Minimum Reference Clamp</i> (01.007) whichever the larger
	$VM\_SPEED\_FREQ\_REF[MIN] = -VM\_SPEED\_FREQ\_REF[MAX]$ .	

<b>VM_SPEED_FREQ_REF_UNIPOLAR</b>		Unipolar version of VM_SPEED_FREQ_REF
Units	Hz	
Range of [MIN]	0.00	
Range of [MAX]	0.00 to 550.00	
Definition	VM_SPEED_FREQ_REF_UNIPOLAR[MAX] = VM_SPEED_FREQ_REF[MAX] VM_SPEED_FREQ_REF_UNIPOLAR[MIN] = 0.00	

<b>VM_SPEED_FREQ_USER_REFS</b>		Range applied to analog reference parameters	
Units	Hz		
Range of [MIN]	-550.00 to 550.00		
Range of [MAX]	0.00 to 550.00		
Definition	This variable maximum is applied to <i>Analog Reference 1</i> (01.036) and <i>Keypad Reference</i> (01.017). The maximum applied to these parameters is the same as other frequency reference parameters. $VM\_SPEED\_FREQ\_USER\_REFS [MAX] = VM\_SPEED\_FREQ\_REF [MAX]$ However the minimum is dependent on <i>Negative Reference Clamp Enable</i> (01.008) and <i>Bipolar Reference Enable</i> (01.010).		
	<b>Negative Reference Clamp Enable (01.008)</b>	<b>Bipolar Reference Enable (01.010)</b>	
	0	0	<i>Minimum Reference Clamp</i> (01.007)
	0	1	$-VM\_SPEED\_FREQ\_REF [MAX]$
	1	0	0.00
	1	1	$-VM\_SPEED\_FREQ\_REF [MAX]$

<b>VM_SUPPLY_LOSS_LEVEL</b>		Range applied to the supply loss threshold
<b>Units</b>	V	
<b>Range of [MIN]</b>	0 to 1150	
<b>Range of [MAX]</b>	0 to 1150	
<b>Definition</b>	VM_SUPPLY_LOSS_LEVEL[MAX] = VM_DC_VOLTAGE_SET[MAX] VM_SUPPLY_LOSS_LEVEL[MIN] is drive voltage rating dependent. See Table 10-4	

<b>VM_TORQUE_CURRENT</b>		Range applied to torque and torque producing current parameters
<b>Units</b>	%	
<b>Range of [MIN]</b>	-1000.0 to 0.0	
<b>Range of [MAX]</b>	0.0 to 1000.0	
<b>Definition</b>	VM_TORQUE_CURRENT[MAX] = VM_MOTOR1_CURRENT_LIMIT[MAX] VM_TORQUE_CURRENT[MIN] = VM_TORQUE_CURRENT[MAX]	

<b>VM_TORQUE_CURRENT_UNIPOLAR</b>		Unipolar version of VM_TORQUE_CURRENT
<b>Units</b>	%	
<b>Range of [MIN]</b>	0.0	
<b>Range of [MAX]</b>	0.0 to 1000.0	
<b>Definition</b>	VM_TORQUE_CURRENT_UNIPOLAR[MAX] = VM_TORQUE_CURRENT[MAX] VM_TORQUE_CURRENT_UNIPOLAR[MIN] = 0.0 <i>User Current Maximum Scaling</i> (04.024) defines the variable maximum/minimums VM_USER_CURRENT which is applied to <i>Percentage Load</i> (04.020) and <i>Torque Reference</i> (04.008). This is useful when routing these parameters to an analog output as it allows the full scale output value to be defined by the user. This maximum is subject to a limit of MOTOR1_CURRENT_LIMIT. The maximum value (VM_TORQUE_CURRENT_UNIPOLAR [MAX]) varies between drive sizes with default parameters loaded. For some drive sizes the default value may be reduced below the value given by the parameter range limiting.	

<b>VM_USER_CURRENT</b>		Range applied to torque reference and percentage load parameters with one decimal place
<b>Units</b>	%	
<b>Range of [MIN]</b>	-1000.0 to 0.0	
<b>Range of [MAX]</b>	0.0 to 1000.0	
<b>Definition</b>	VM_USER_CURRENT[MAX] = <i>User Current Maximum Scaling</i> (04.024) VM_USER_CURRENT[MIN] = -VM_USER_CURRENT[MAX] <i>User Current Maximum Scaling</i> (04.024) defines the variable maximum/minimums VM_USER_CURRENT which is applied to <i>Percentage Load</i> (04.020) and <i>Torque Reference</i> (04.008). This is useful when routing these parameters to an analog output as it allows the full scale output value to be defined by the user. This maximum is subject to a limit of MOTOR1_CURRENT_LIMIT. The maximum value (VM_TORQUE_CURRENT_UNIPOLAR [MAX]) varies between drive sizes with default parameters loaded. For some drive sizes the default value may be reduced below the value given by the parameter range limiting.	

**Table 10-4 Voltage ratings dependant values**

Variable min/max	Voltage level		
	100 V	200 V	400 V
VM_DC_VOLTAGE_SET(MAX)	400		800
VM_DC_VOLTAGE(MAX) Frame 1 to 4	510		870
VM_AC_VOLTAGE_SET(MAX) Frame 1 to 4	240		480
VM_AC_VOLTAGE(MAX)	325		650
VM_STD_UNDER_VOLTS(MIN)	175		330
VM_SUPPLY_LOSS_LEVEL(MIN)	205		410

# 11 Diagnostics

The keypad display on the drive gives various information about the status of the drive. The keypad display provides information on the following categories:

- Trip indications
- Alarm indications
- Status indications

Users must not attempt to repair a drive if it is faulty, nor carry out fault diagnosis other than through the use of the diagnostic features described in this chapter. If a drive is faulty, it must be returned to an authorized Control Techniques distributor for repair.

## 11.1 Status modes

Figure 11-1 Keypad status modes

- 1 Drive OK status
- 2 Trip status
- 3 Alarm status

## 11.2 Trip indications

The output of the drive is disabled under any trip condition so that the drive stops controlling the motor. If the motor is running when the trip occurs it will coast to a stop.

During a trip condition, the display indicates that a trip has occurred and the keypad will display the trip string. Some trips have a sub-trip number to provide additional information about the trip. If a trip has a sub-trip number, the sub-trip number is flashed alternately with the trip string.

Trips are listed alphabetically in Table 11-2 based on the trip indication shown on the drive display.

## 11.3 Identifying a trip / trip source

Some trips only contain a trip string whereas some other trips have a trip string along with a sub-trip number which provides the user with additional information about the trip.

A trip can be generated from a control system or from a power system. The sub-trip number associated with the trips listed in Table 11-1 is in the form xxyz and used to identify the source of the trip.

Table 11-1 Trips associated with xxyz sub-trip number

OV	OI.Sn
PSU	PH.Lo
Oht.I	tH.Fb
Oht.P	P.dAt
Oh.dc	

The digits xx are 00 for a trip generated by the control system. For a drive, if the trip is related to the power system then xx will have a value of 01, when displayed the leading zeros are suppressed.

For a control system trip (xx is zero), the y digit where relevant is defined for each trip. If not relevant, the y digit will have a value of zero.

The zz digits give the reason for the trip and are defined in each trip description.

Figure 11-2 Key to sub-trip number

## 11.4 Trips, Sub-trip numbers

Table 11-2 Trip indications

Trip	Diagnosis								
<b>C.Acc</b>	<b>NV Media Card Write fail</b>								
185	<p>The <i>C.Acc</i> trip indicates that the drive was unable to access the NV Media Card. If the trip occurs during the data transfer to the card then the file being written may be corrupted. If the trip occurs when the data being transferred to the drive then the data transfer may be incomplete. If a parameter file is transferred to the drive and this trip occurs during the transfer, the parameters are not saved to non-volatile memory, and so the original parameters can be restored by powering the drive down and up again.</p> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Check NV Media Card is installed / located correctly</li> <li>• Replace the NV Media Card</li> </ul>								
<b>C.cPr</b>	<b>NV Media Card file/data is different to the one in the drive</b>								
188	<p>A compare has been carried out between a file on the NV Media Card and the drive, a <i>C.cPr</i> trip is initiated if the parameters on the NV Media Card are different to the drive.</p> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Set Pr <b>mm.000</b> to 0 and reset the trip</li> <li>• Check to ensure the correct data block on the NV Media Card has been used for the compare</li> </ul>								
<b>C.d.E</b>	<b>NV Media Card data location already contains data</b>								
179	<p>The <i>C.d.E</i> trip indicates that an attempt has been made to store data on a NV Media Card in a data block which already contains data.</p> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Erase the data in data location</li> <li>• Write data to an alternative data location</li> </ul>								
<b>C.dAt</b>	<b>NV Media Card data not found</b>								
183	<p>The <i>C.dAt</i> trip indicates that an attempt has been made to access a non-existent file on the NV Media Card. No data is transferred.</p> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Ensure data file number is correct</li> </ul>								
<b>C.Err</b>	<b>NV Media Card data structure error</b>								
182	<p>The <i>C.Err</i> trip indicates that an attempt has been made to access the NV Media Card but an error has been detected in the data structure on the card. Resetting the trip will cause the drive to erase and create the correct folder structure. On an SD card, whilst this trip is present, missing directories will be created and if the header file is missing it will be created. The cause of the trip can be identified by the sub-trip.</p> <table border="1"> <thead> <tr> <th>Sub-trip</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>The required folder and file structure is not present</td> </tr> <tr> <td>2</td> <td>The 000.DAT file is corrupted</td> </tr> <tr> <td>3</td> <td>Two or more files in the &lt;MCDf&gt; folder have the same file identification number</td> </tr> </tbody> </table> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Erase all the data block and re-attempt the process</li> <li>• Ensure the card is located correctly</li> <li>• Replace the NV Media Card</li> </ul>	Sub-trip	Reason	1	The required folder and file structure is not present	2	The 000.DAT file is corrupted	3	Two or more files in the <MCDf> folder have the same file identification number
Sub-trip	Reason								
1	The required folder and file structure is not present								
2	The 000.DAT file is corrupted								
3	Two or more files in the <MCDf> folder have the same file identification number								
<b>C.FuL</b>	<b>NV Media Card full</b>								
184	<p>The <i>C.FuL</i> trip indicates that an attempt has been made to create a data block on a NV Media Card, but there is not enough space left on the card. No data is transferred.</p> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Delete a data block or the entire NV Media Card to create space</li> <li>• Use a different NV Media Card</li> </ul>								

Trip	Diagnosis						
<b>C.Pr</b>	<b>NV Media Card data blocks are not compatible with the drive derivative</b>						
175	<p>The <i>C.Pr</i> trip is initiated either at power-up or when the card is accessed, If <i>Drive Derivative</i> (11.028) or <i>Product Type</i> (11.063) are different between the source and target drives. This trip can be reset and data can be transferred in either direction between the drive and the card.</p> <table border="1"> <thead> <tr> <th>Sub-trip</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>If <i>Drive Derivative</i> (11.028) is different between the source and target drives. This trip is initiated either at power-up or when the SD card is accessed. This trip can be reset and data can be transferred in either direction between the drive and the card.</td> </tr> <tr> <td>2</td> <td>If <i>Product Type</i> (11.063) is different between the source and target drives or the file is corrupted or incompatible. This trip is initiated either at power-up or when the SD card is accessed. This trip can be reset but no data are transferred in either direction between the drive and the card.</td> </tr> </tbody> </table> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Use a different NV Media Card</li> <li>• This trip can be suppressed by setting Pr <b>mm.000</b> to 9666 and resetting the drive</li> <li>• Choose a file compatible between the source and target drives, if sub-trip 2.</li> </ul>	Sub-trip	Reason	1	If <i>Drive Derivative</i> (11.028) is different between the source and target drives. This trip is initiated either at power-up or when the SD card is accessed. This trip can be reset and data can be transferred in either direction between the drive and the card.	2	If <i>Product Type</i> (11.063) is different between the source and target drives or the file is corrupted or incompatible. This trip is initiated either at power-up or when the SD card is accessed. This trip can be reset but no data are transferred in either direction between the drive and the card.
Sub-trip	Reason						
1	If <i>Drive Derivative</i> (11.028) is different between the source and target drives. This trip is initiated either at power-up or when the SD card is accessed. This trip can be reset and data can be transferred in either direction between the drive and the card.						
2	If <i>Product Type</i> (11.063) is different between the source and target drives or the file is corrupted or incompatible. This trip is initiated either at power-up or when the SD card is accessed. This trip can be reset but no data are transferred in either direction between the drive and the card.						
<b>C.rdo</b>	<b>NV Media Card has the Read Only bit set</b>						
181	<p>The <i>C.rdo</i> trip indicates that an attempt has been made to modify data on a read-only NV Media Card or to modify a read-only data block. A NV Media Card is read-only if the read-only flag has been set.</p> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Clear the read only flag by setting Pr <b>mm.000</b> to 9777 and reset the drive. This will clear the read-only flag for all data blocks in the NV Media Card</li> </ul>						
<b>C.rtg</b>	<b>NV Media Card Trip; The voltage and / or current rating of the source and destination drives are different</b>						
186	<p>The <i>C.rtg</i> trip indicates that parameter data is being transferred from the NV Media Card to the drive, but the current and / or voltage ratings are different between source and destination drives. This trip also applies if a compare (using Pr <b>mm.000</b> set to 8yyy) is performed between the data block on a NV Media Card and the drive. The <i>C.rtg</i> trip does not stop the data transfer but is a warning that rating specific parameters with the RA attribute may not be transferred to the destination drive.</p> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Reset the drive to clear the trip</li> <li>• Ensure that the drive rating dependent parameters have transferred correctly</li> <li>• This trip can be suppressed by setting Pr <b>mm.000</b> to 9666 and resetting the drive.</li> </ul>						
<b>C.tyP</b>	<b>NV Media Card parameter set not compatible with current drive mode</b>						
187	<p>The <i>C.tyP</i> trip is produced during a compare if the drive mode in the data block on the NV Media Card is different from the current drive mode. This trip is also produced if an attempt is made to transfer parameters from a NV Media Card to the drive if the operating mode in the data block is outside the allowed range of operating modes, for the target drive.</p> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Ensure the destination drive supports the drive operating mode in the parameter file.</li> <li>• Clear the value in Pr <b>mm.000</b> and reset the drive</li> <li>• Ensure destination drive operating mode is the same as the source parameter file</li> </ul>						
<b>cL.A1</b>	<b>Analog input 1 current loss</b>						
28	<p>The <i>cL.A1</i> trip indicates that a current loss was detected in current mode on Analog input 1 (Terminal 2). In 4-20 mA and 20-4 mA modes loss of input is detected if the current falls below 3 mA.</p> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Check control wiring is correct</li> <li>• Check control wiring is undamaged</li> <li>• Check the <i>Analog Input 1 Mode</i> (07.007)</li> <li>• Current signal is present and greater than 3 mA</li> </ul>						
<b>Cur.c</b>	<b>Current calibration range</b>						
231	<p>Current calibration range error.</p> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Hardware fault - contact the supplier of the drive.</li> </ul>						
<b>Cur.O</b>	<b>Current feedback offset error</b>						
225	<p>The <i>Cur.O</i> trip indicates that the current offset is too large to be trimmed.</p> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Ensure that there is no possibility of current flowing in the output phases of the drive when the drive is not enabled</li> <li>• Hardware fault – contact the supplier of the drive</li> </ul>						

Trip	Diagnosis												
<b>d.Ch</b>	<b>Drive parameters are being changed</b>												
<b>97</b>	<p>A user action or a file system write is active that is changing the drive parameters and the drive has been commanded to enable, i.e. <i>Drive Active</i> (10.002) = 1.</p> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Ensure the drive is not enabled when defaults are being loaded</li> </ul>												
<b>dEr.E</b>	<b>Derivative file error</b>												
<b>246</b>	<p>Derivative file error with sub-trips:</p> <table border="1"> <thead> <tr> <th>Sub-trip</th> <th>Reason</th> <th>Comments</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>The derivative file is missing or is invalid</td> <td>Occurs when the drive powers-up. Load valid derivative file matching the control board hardware.</td> </tr> <tr> <td>2</td> <td>The derivative file does not match the control board hardware</td> <td>Occurs when the drive powers-up. Load valid derivative file matching the control board hardware.</td> </tr> <tr> <td>3</td> <td>The derivative file has been changed for a file with a different derivative number.</td> <td>Occurs when the drive powers-up or the file is programmed. The file tasks will not run.</td> </tr> </tbody> </table> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Contact the supplier of the drive.</li> </ul>	Sub-trip	Reason	Comments	1	The derivative file is missing or is invalid	Occurs when the drive powers-up. Trip	Diagnosis																				
<b>EEF</b>	<b>Default parameters have been loaded</b>																				
31	The <i>EEF</i> trip indicates that default parameters have been loaded. The exact cause/reason of the trip can be identified from the sub-trip number.																				
	<table border="1"> <thead> <tr> <th>Sub-trip</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>The most significant digit of the internal parameter database version number has changed</td> </tr> <tr> <td>2</td> <td>The CRC's applied to the parameter data stored in internal non-volatile memory indicate that a valid set of parameters cannot be loaded</td> </tr> <tr> <td>3</td> <td>The drive mode restored from internal non-volatile memory is outside the allowed range for the product or the derivative image does not allow the previous drive mode</td> </tr> <tr> <td>4</td> <td>The drive derivative image has changed</td> </tr> <tr> <td>5</td> <td>The power stage hardware has changed</td> </tr> <tr> <td>6</td> <td>Reserved</td> </tr> <tr> <td>7</td> <td>Reserved</td> </tr> <tr> <td>8</td> <td>The control board hardware has changed</td> </tr> <tr> <td>9</td> <td>The checksum on the non-parameter area of the EEPROM has failed</td> </tr> </tbody> </table>	Sub-trip	Reason	1	The most significant digit of the internal parameter database version number has changed	2	The CRC's applied to the parameter data stored in internal non-volatile memory indicate that a valid set of parameters cannot be loaded	3	The drive mode restored from internal non-volatile memory is outside the allowed range for the product or the derivative image does not allow the previous drive mode	4	The drive derivative image has changed	5	The power stage hardware has changed	6	Reserved	7	Reserved	8	The control board hardware has changed	9	The checksum on the non-parameter area of the EEPROM has failed
	Sub-trip	Reason																			
	1	The most significant digit of the internal parameter database version number has changed																			
	2	The CRC's applied to the parameter data stored in internal non-volatile memory indicate that a valid set of parameters cannot be loaded																			
	3	The drive mode restored from internal non-volatile memory is outside the allowed range for the product or the derivative image does not allow the previous drive mode																			
	4	The drive derivative image has changed																			
	5	The power stage hardware has changed																			
	6	Reserved																			
	7	Reserved																			
8	The control board hardware has changed																				
9	The checksum on the non-parameter area of the EEPROM has failed																				
The drive holds two banks of user save parameters and two banks of power down save parameters in non-volatile memory. If the last bank of either set of parameters that was saved is corrupted a U.S or Pd.S trip is produced. If one of these trips occurs the parameters values that were last saved successfully are used. It can take some time to save parameters when requested by the user and if the power is removed from the drive during this process it is possible to corrupt the data in the non-volatile memory.																					
If both banks of user save parameters or both banks of power down save parameters are corrupted or one of the other conditions given in the table above occurs <i>EEF.xxx</i> trip is produced. If this trip occurs it is not possible to use the data that has been saved previously, and so the drive will be loaded with default parameters. The trip can only be reset if Parameter <b>mm.000</b> (mm.000) is set to 10, 11, 1233 or 1244 or if Load Defaults (11.043) is set to a non-zero value.																					
<b>Recommended actions:</b>																					
<ul style="list-style-type: none"> <li>• Default the drive and perform a reset</li> <li>• Allow sufficient time to perform a save before the supply to the drive is removed</li> <li>• If the trip persists - return drive to supplier</li> </ul>																					
<b>Et</b>	<b>An External trip is initiated</b>																				
6	An <i>Et</i> trip has occurred. The cause of the trip can be identified from the sub trip number displayed after the trip string. See table below.																				
	<table border="1"> <thead> <tr> <th>Sub-trip</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td>3</td> <td><i>External Trip</i> (10.032) = 1</td> </tr> </tbody> </table>	Sub-trip	Reason	3	<i>External Trip</i> (10.032) = 1																
Sub-trip	Reason																				
3	<i>External Trip</i> (10.032) = 1																				
	<b>Recommended actions:</b>																				
	<ul style="list-style-type: none"> <li>• Check the value of Pr <b>10.032</b>.</li> <li>• Select 'dest' (or enter 12001) in Pr <b>mm.000</b> and check for a parameter controlling Pr <b>10.032</b>.</li> </ul>																				
<b>FAn.F</b>	<b>Fan fail</b>																				
173	This trip cannot be reset until 10s after the trip was initiated.																				
	<b>Recommended actions:</b>																				
	<ul style="list-style-type: none"> <li>• Check that the fan is installed and connected correctly.</li> <li>• Check that the fan is not obstructed.</li> <li>• Contact the supplier of the drive to replace the fan.</li> </ul>																				
<b>Fi.Ch</b>	<b>File changed</b>																				
247	<b>Recommended action:</b>																				
	<ul style="list-style-type: none"> <li>• Power cycle the drive.</li> </ul>																				
<b>FI.In</b>	<b>Firmware Incompatibility</b>																				
237	The <i>FI.In</i> trip indicates that the user firmware is incompatible with the power firmware.																				
	<b>Recommended actions:</b>																				
	<ul style="list-style-type: none"> <li>• Contact the supplier of the drive.</li> </ul>																				
<b>HF01</b>	<b>Data processing error: CPU hardware fault</b>																				
	The <i>HF01</i> trip indicates that a CPU address error has occurred. This trip indicates that the control PCB on the drive has failed.																				
	<b>Recommended actions:</b>																				
	<ul style="list-style-type: none"> <li>• Hardware fault – Contact the supplier of the drive</li> </ul>																				

Trip	Diagnosis										
<b>HF02</b>	<b>Data processing error: CPU memory management fault</b>										
	The <i>HF02</i> trip indicates that a DMAC address error has occurred. This trip indicates that the control PCB on the drive has failed. <b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Hardware fault – Contact the supplier of the drive</li> </ul>										
<b>HF03</b>	<b>Data processing error: CPU has detected a bus fault</b>										
	The <i>HF03</i> trip indicates that a bus fault has occurred. This trip indicates that the control PCB on the drive has failed. <b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Hardware fault – Contact the supplier of the drive</li> </ul>										
<b>HF04</b>	<b>Data processing error: CPU has detected a usage fault</b>										
	The <i>HF04</i> trip indicates that a usage fault has occurred. This trip indicates that the control PCB on the drive has failed. <b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Hardware fault – Contact the supplier of the drive</li> </ul>

<b>HF07</b>	<b>Data processing error: Watchdog failure</b>										
	The <i>HF07</i> trip indicates that a watchdog failure has occurred. This trip indicates that the control PCB on the drive has failed. <b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Hardware fault – Contact the supplier of the drive</li> </ul>										
<b>HF08</b>	<b>Data processing error: CPU Interrupt crash</b>										
	The <i>HF08</i> trip indicates that a CPU interrupt crash has occurred. This trip indicates that the control PCB on the drive has failed. The crash level is indicated by the sub-trip number. <b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Hardware fault – Contact the supplier of the drive</li> </ul>										
<b>HF09</b>	<b>Data processing error: Free store overflow</b>										
	The <i>HF09</i> trip indicates that a free store overflow has occurred. This trip indicates that the control PCB on the drive has failed. <b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Hardware fault – Contact the supplier of the drive</li> </ul>										
<b>HF10</b>	<b>Reserved</b>										
<b>HF11</b>	<b>Data processing error: Non-volatile memory comms error</b>										
	The <i>HF11</i> trip indicates that a non-volatile memory comms error has occurred. The crash level is indicated by the sub-trip number. This trip indicates that the control PCB on the drive has failed.										
	<table border="1"> <thead> <tr> <th>Sub-trip</th> <th>Reason</th> <th>Recommended action</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Non-volatile memory comms error.</td> <td>Hardware fault – contact the supplier of the drive.</td> </tr> <tr> <td>2</td> <td>EEPROM size is incompatible with the user firmware.</td> <td>Contact the supplier of the drive.</td> </tr> </tbody> </table>	Sub-trip	Reason	Recommended action	1	Non-volatile memory comms error.	Hardware fault – contact the supplier of the drive.	2	EEPROM size is incompatible with the user firmware.	Contact the supplier of the drive.	
Sub-trip	Reason	Recommended action									
1	Non-volatile memory comms error.	Hardware fault – contact the supplier of the drive.									
2	EEPROM size is incompatible with the user firmware.	Contact the supplier of the drive.									
<b>HF12</b>	<b>Data processing error: main program stack overflow</b>										
	The <i>HF12</i> trip indicates that the main program stack overflow has occurred. The stack can be identified by the sub-trip number. This trip indicates that the control PCB on the drive has failed.										
	<table border="1"> <thead> <tr> <th>Sub-trip</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Derivative background stack overflow</td> </tr> <tr> <td>2</td> <td>Derivative timed stack overflow</td> </tr> <tr> <td>3</td> <td>Main system interrupt stack overflow</td> </tr> <tr> <td>4</td> <td>Main system background stack overflow</td> </tr> </tbody> </table>	Sub-trip	Reason	1	Derivative background stack overflow	2	Derivative timed stack overflow	3	Main system interrupt stack overflow	4	Main system background stack overflow
Sub-trip	Reason										
1	Derivative background stack overflow										
2	Derivative timed stack overflow										
3	Main system interrupt stack overflow										
4	Main system background stack overflow										
	<b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Hardware fault - Contact the supplier of the drive.</li> </ul>										
<b>HF13</b>	<b>Reserved</b>										
<b>HF14</b>	<b>Reserved</b>										

Trip	Diagnosis						
<b>HF15</b>	<b>Reserved</b>						
<b>HF16</b>	<b>Data processing error: RTOS error</b> The <i>HF16</i> trip indicates that a RTOS error has occurred. This trip indicates that the control PCB on the drive has failed. <b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Hardware fault – Contact the supplier of the drive</li> </ul>						
<b>HF17</b>	<b>Reserved</b>						
<b>HF18</b>	<b>Reserved</b>						
<b>HF19</b>	<b>Data processing error: CRC check on the firmware has failed</b> The <i>HF19</i> trip indicates that the CRC check on the drive firmware has failed. <b>Recommended actions:</b> <ul style="list-style-type: none"> <li>If this trip occurs - contact the supplier of the drive</li> </ul>						
<b>HF23</b>	<b>Hardware fault</b> <b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Hardware fault - Contact the supplier of the drive</li> </ul>						
<b>It.Ac</b>	<b>Output current overload timed out (I<sup>2</sup>t)</b> The <i>It.Ac</i> trip indicates a motor thermal overload based on the <i>Motor Rated Current</i> (Pr <b>05.007</b> ) and <i>Motor Thermal Time Constant</i> (Pr <b>04.015</b> ). Pr <b>04.019</b> displays the motor temperature as a percentage of the maximum value. The drive will trip on <i>It.Ac</i> when Pr <b>04.019</b> gets to 100 %. <b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Ensure the load is not jammed / sticking</li> <li>Check the load on the motor has not changed</li> <li>Ensure the motor rated current is not zero</li> </ul>						
<b>It.br</b>	<b>Braking resistor overload timed out (I<sup>2</sup>t)</b> The <i>It.br</i> trip indicates that braking resistor overload has timed out. The value in <i>Braking Resistor Thermal Accumulator</i> (10.039) is calculated using <i>Braking Resistor Rated Power</i> (10.030), <i>Braking Resistor Thermal Time Constant</i> (10.031) and <i>Braking Resistor Resistance</i> (10.061). The <i>It.br</i> trip is initiated when the <i>Braking Resistor Thermal Accumulator</i> (10.039) reaches 100 %. <b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Ensure the values entered in Pr <b>10.030</b>, Pr <b>10.031</b> and Pr <b>10.061</b> are correct.</li> <li>Check resistor value and power rating.</li> <li>If an external thermal protection device is being used and the braking resistor software overload protection is not required, set Pr <b>10.030</b>, Pr <b>10.031</b> or Pr <b>10.061</b> to 0 to disable the trip.</li> </ul>						
<b>no.PS</b>	<b>No power board</b> No communication between the power and control boards. <b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Hardware fault - Contact the supplier of the drive</li> </ul>						
<b>236</b>	<b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Hardware fault - Contact the supplier of the drive</li> </ul>						
<b>O.Ld1</b>	<b>Digital output overload</b> This trip indicates that the total current drawn from the AI Adaptor 24 V or from the digital output has exceeded the limit.						
<b>26</b>	<table border="1"> <thead> <tr> <th>Sub-trip</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Digital output or 24 V supply load on control terminal is too high.</td> </tr> <tr> <td>2</td> <td>AI Adaptor 24 V load is too high</td> </tr> </tbody> </table> <b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Check total loads on digital outputs and 24 V</li> <li>Check control wiring is correct</li> <li>Check output wiring is undamaged</li> </ul>	Sub-trip	Reason	1	Digital output or 24 V supply load on control terminal is too high.	2	AI Adaptor 24 V load is too high
Sub-trip	Reason						
1	Digital output or 24 V supply load on control terminal is too high.						
2	AI Adaptor 24 V load is too high						
<b>O.SPd</b>	<b>Motor frequency has exceeded the over frequency threshold</b> In open-loop mode, if the <i>Post-ramp Reference</i> (02.001) exceeds the threshold set in the <i>Over Frequency Threshold</i> (03.008) in either direction, an <i>O.SPd</i> trip is produced. If Pr <b>03.008</b> is set to 0.00 the threshold is then equal to 1.2 x the value set in Pr <b>01.006</b> . <b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Check that a mechanical load is not driving motor</li> </ul>						
<b>7</b>	<b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Check that a mechanical load is not driving motor</li> </ul>						

Trip	Diagnosis										
<b>Oh.dc</b>	<b>DC bus over temperature</b>										
	The <i>Oh.dc</i> trip indicates a DC bus component over temperature based on a software thermal model. The drive includes a thermal protection system to protect the DC bus components within the drive. This includes the effects of the output current and DC bus ripple. The estimated temperature is displayed as a percentage of the trip level in Pr <b>07.035</b> . If this parameter reaches 100 % then an <i>Oh.dc</i> trip is initiated. The drive will attempt to stop the motor before tripping. If the motor does not stop in 10 seconds the drive trips immediately.										
	<table border="1"> <thead> <tr> <th>Source</th> <th>xx</th> <th>y</th> <th>zz</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Control system</td> <td>00</td> <td>2</td> <td>00</td> <td>DC bus thermal model gives trip with sub-trip 0</td> </tr> </tbody> </table>	Source	xx	y	zz	Description	Control system	00	2	00	DC bus thermal model gives trip with sub-trip 0
Source	xx	y	zz	Description							
Control system	00	2	00	DC bus thermal model gives trip with sub-trip 0							
<b>27</b>	<p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Check the AC supply voltage balance and levels</li> <li>• Check DC bus ripple level</li> <li>• Reduce duty cycle</li> <li>• Reduce motor load</li> <li>• Check the output current stability. If unstable; <ul style="list-style-type: none"> <li>Check the motor map settings with motor nameplate (Pr <b>05.006</b>, Pr <b>05.007</b>, Pr <b>05.008</b>, Pr <b>05.009</b>, Pr <b>05.010</b>, Pr <b>05.011</b>)</li> <li>Disable slip compensation (Pr <b>05.027</b> = 0)</li> <li>Disable dynamic V to F operation (Pr <b>05.013</b> = 0)</li> <li>Select fixed boost (Pr <b>05.014</b> = Fixed)</li> <li>Select high stability space vector modulation (Pr <b>05.019</b> = 1)</li> <li>Disconnect the load and complete a rotating autotune (Pr <b>05.012</b>)</li> </ul> </li> </ul>										
<b>Oht.C</b>	<b>Control stage over-temperature</b>										
<b>219</b>	<p>This trip indicates that a control stage over-temperature has been detected if Cooling Fan control (06.045) = 0.</p> <p><b>Recommended actions:</b></p> <p>Increase ventilation by setting Cooling Fan control (06.045) &gt; 0</p>										
<b>Oht.I</b>	<b>Inverter over temperature based on thermal model</b>										
	This trip indicates that an IGBT junction over-temperature has been detected based on a software thermal model. The <i>Oht.I</i> trip is initiated when the temperature based on the thermal model reaches 145 °C. The trip reset temperature is 139 °C.										
	<table border="1"> <thead> <tr> <th>Source</th> <th>xx</th> <th>y</th> <th>zz</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Control system</td> <td>00</td> <td>1</td> <td>00</td> <td>Inverter thermal model gives {Oht.I} trip with sub-trip 100</td> </tr> </tbody> </table>	Source	xx	y	zz	Description	Control system	00	1	00	Inverter thermal model gives {Oht.I} trip with sub-trip 100

Drive size	Trip temperature (°C)	Trip reset temperature (°C)									
1 to 4	95	90									
<b>22</b>	<p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Check enclosure / drive fans are still functioning correctly</li> <li>• Force the heatsink fans to run at maximum speed</li> <li>• Check enclosure ventilation paths</li> <li>• Check enclosure door filters</li> <li>• Increase ventilation</li> <li>• Reduce the drive switching frequency</li> <li>• Reduce duty cycle</li> <li>• Increase acceleration / deceleration rates</li> <li>• Use S ramp (Pr <b>02.006</b>)</li> <li>• Reduce motor load</li> <li>• Check the derating tables and confirm the drive is correctly sized for the application.</li> <li>• Use a drive with larger current / power rating</li> </ul>										
<b>OI.A1</b>	<b>Analog input 1 over-current</b>										
<b>189</b>	Current input on analog input 1 exceeds 24mA.										
<b>OI.AC</b>	<b>Instantaneous output over current detected</b>										
	The instantaneous drive output current has exceeded VM_DRIVE_CURRENT_MAX. This trip cannot be reset until 10s after the trip was initiated.										
<b>3</b>	<p><b>Recommended actions/checks:</b></p> <ul style="list-style-type: none"> <li>• Increase acceleration/deceleration rate</li> <li>• If seen during autotune reduce the voltage boost</li> <li>• Check for short circuit on the output cabling</li> <li>• Check integrity of the motor insulation using an insulation tester</li> <li>• Is the motor cable length within limits for the frame size?</li> <li>• Reduce the values in the current loop gain parameters</li> </ul>										
<b>OI.br</b>	<b>Braking IGBT over current detected: short circuit protection for the braking IGBT activated</b>										
	The <i>OI.br</i> trip indicates that over current has been detected in braking IGBT or braking IGBT protection has been activated. This trip cannot be reset until 10s after the trip was initiated.										
<b>4</b>	<p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Check brake resistor wiring</li> <li>• Check braking resistor value is greater than or equal to the minimum resistance value</li> <li>• Check braking resistor insulation</li> </ul>										
<b>OI.SC</b>	<b>Output phase short-circuit</b>										
	Over-current detected on drive output when enabled. Possible motor ground fault.										
<b>228</b>	<p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Check for short circuit on the output cabling</li> <li>• Check integrity of the motor insulation using an insulation tester</li> <li>• Is the motor cable length within limits for the frame size?</li> </ul>										

Trip	Diagnosis															
<b>Out.P</b>	<b>Output phase loss detected</b>															
98	The <i>Out.P</i> trip indicates that phase loss has been detected at the drive output.															
	<table border="1"> <thead> <tr> <th>Sub-trip</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>U phase detected as disconnected when drive enabled to run.</td> </tr> <tr> <td>2</td> <td>V phase detected as disconnected when drive enabled to run.</td> </tr> <tr> <td>3</td> <td>W phase detected as disconnected when drive enabled to run.</td> </tr> <tr> <td>4</td> <td>The drive output frequency is above 4 Hz and a phase is disconnected for the time specified by <i>Output Phase Loss Detection Time</i> (06.058).</td> </tr> </tbody> </table>	Sub-trip	Reason	1	U phase detected as disconnected when drive enabled to run.	2	V phase detected as disconnected when drive enabled to run.	3	W phase detected as disconnected when drive enabled to run.	4	The drive output frequency is above 4 Hz and a phase is disconnected for the time specified by <i>Output Phase Loss Detection Time</i> (06.058).					
	Sub-trip	Reason														
	1	U phase detected as disconnected when drive enabled to run.														
	2	V phase detected as disconnected when drive enabled to run.														
3	W phase detected as disconnected when drive enabled to run.															
4	The drive output frequency is above 4 Hz and a phase is disconnected for the time specified by <i>Output Phase Loss Detection Time</i> (06.058).															
<b>NOTE</b>	If Pr <b>05.042</b> = 1, the physical output phases are reversed, and so sub-trip 3 refers to physical output phase V and sub-trip 2 refers to physical output phase W.															
<b>Recommended actions:</b>	<ul style="list-style-type: none"> <li>Check motor and drive connections</li> <li>To disable the trip set <i>Output Phase Loss Detection Enable</i> (06.059) = 0</li> </ul>															
<b>OV</b>	<b>DC bus voltage has exceeded the peak level or maximum continuous level for 15 seconds</b>															
2	The OV trip indicates that the DC bus voltage has exceeded the VM_DC_VOLTAGE[MAX] or VM_DC_VOLTAGE_SET[MAX] for 15 s. The trip threshold varies depending on voltage rating of the drive as shown below.															
	<table border="1"> <thead> <tr> <th>Voltage rating</th> <th>VM_DC_VOLTAGE[MAX]</th> <th>VM_DC_VOLTAGE_SET[MAX]</th> </tr> </thead> <tbody> <tr> <td>100</td> <td>510</td> <td>400</td> </tr> <tr> <td>200</td> <td>510</td> <td>400</td> </tr> <tr> <td>400</td> <td>870</td> <td>800</td> </tr> </tbody> </table>	Voltage rating	VM_DC_VOLTAGE[MAX]	VM_DC_VOLTAGE_SET[MAX]	100	510	400	200	510	400	400	870	800			
	Voltage rating	VM_DC_VOLTAGE[MAX]	VM_DC_VOLTAGE_SET[MAX]													
	100	510	400													
	200	510	400

Trip	Diagnosis																																																							
<b>P.dAt</b>	<b>Power system configuration data error</b>																																																							
<b>220</b>	The <i>P.dAt</i> trip indicates that there is an error in the configuration data stored in the power system. This trip is generated from within the drive control system or from the power system. The trip is related to the table uploaded from the power system at power-up.																																																							
	<table border="1"> <thead> <tr> <th>Source</th> <th>xx</th> <th>y</th> <th>zz</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Control system</td> <td>00</td> <td>0</td> <td>01</td> <td>No data was obtained from the power board.</td> </tr> <tr> <td>Control system</td> <td>00</td> <td>0</td> <td>02</td> <td>There is no data table.</td> </tr> <tr> <td>Control system</td> <td>00</td> <td>0</td> <td>03</td> <td>The power system data table is bigger than the space available in the control pod to store it.</td> </tr> <tr> <td>Control system</td> <td>00</td> <td>0</td> <td>04</td> <td>The size of the table given in the table is incorrect.</td> </tr> <tr> <td>Control system</td> <td>00</td> <td>0</td> <td>05</td> <td>Table CRC error.</td> </tr> <tr> <td>Control system</td> <td>00</td> <td>0</td> <td>06</td> <td>The version number of the generator software that produced the table is too low.</td> </tr> <tr> <td>Control system</td> <td>0</td> <td>0</td> <td>07</td> <td>The power data table failed to be stored in the power board.</td> </tr> <tr> <td>Power system</td> <td>01</td> <td>0</td> <td>00</td> <td>The power data table used internally by the power module has an error.</td> </tr> <tr> <td>Power system</td> <td>01</td> <td>0</td> <td>01</td> <td>The power data table that is uploaded to the control system on power up has an error.</td> </tr> <tr> <td>Power system</td> <td>01</td> <td>0</td> <td>02</td> <td>The power data table used internally by the power module does not match the hardware identification of the power module.</td> </tr> </tbody> </table>	Source	xx	y	zz	Description	Control system	00	0	01	No data was obtained from the power board. <b>Pd.S</b>	<b>Power down save error</b>																																																							
<b>37</b>	The <i>Pd.S</i> trip indicates that an error has been detected in the power down save parameters saved in non-volatile memory.																																																							
<b>Recommended actions:</b>																																																								
<ul style="list-style-type: none"> <li>Perform a 1001 save in Pr <b>mm.000</b> to ensure that the trip doesn't occur the next time the drive is powered up.</li> </ul>																																																								

Trip	Diagnosis			
<b>PH.Lo</b>	<b>Supply phase loss</b>			
32	The <i>PH.Lo</i> trip indicates that the drive has detected an input phase loss or large supply imbalance. The drive will attempt to stop the motor before this trip is initiated. If the motor cannot be stopped in 10 seconds the trip occurs immediately. The <i>PH.Lo</i> trip works by monitoring the ripple voltage on the DC bus of the drive, if the DC bus ripple exceeds the threshold, the drive will trip on PH.Lo. Potential causes of the DC bus ripple are input phase loss, Large supply impedance and severe output current instability.			
	<b>Source</b>	<b>xx</b>	<b>y</b>	<b>zz</b>
	Control system	00	0	00: Phase loss detected based on control system feedback. The drive attempts to stop the drive before tripping unless bit 2 of <i>Action On Trip Detection</i> (10.037) is set to one.
Input phase loss detection can be disabled when the drive is required to operate from the DC supply or from a single phase supply in <i>Input Phase Loss Detection Mode</i> (06.047).				
<b>Recommended actions:</b>				
<ul style="list-style-type: none"> <li>• Check the AC supply voltage balance and level at full load</li> <li>• Check the DC bus ripple level with an isolated oscilloscope</li> <li>• Check the output current stability</li> <li>• Check for mechanical resonance with the load</li> <li>• Reduce the duty cycle</li> <li>• Reduce the motor load</li> <li>• Disable the phase loss detection, set Pr <b>06.047</b> to 2.</li> </ul>				
<b>PSU</b>	<b>Internal power supply fault</b>

Trip	Diagnosis												
<b>rS</b>	<b>Measured resistance has exceeded the parameter range</b>												
33	<p>The rS trip indicates that the measured stator resistance of the motor during an autotune test has exceeded the maximum possible value of <i>Stator Resistance</i> (05.017).</p> <p>If the measured value or a value written to this parameter by the user exceeds <math>(V_{FS}/\sqrt{2}) / \text{Full Scale Current } Kc</math> (11.061), where <math>V_{FS}</math> is the full scale DC bus voltage then this trip is initiated.</p> <p>The stationary autotune is initiated using the autotune function (Pr <b>05.012</b>) or in open loop vector mode (Pr <b>05.014</b>) on the first run command after power up in mode 4 (Ur_I) or on every run command in modes 0 (Ur_S) or 3 (Ur_Auto). This trip can occur if the motor is very small in comparison to the rating of the drive.</p> <p>If the value is the result of a measurement made by the drive then sub-trip 0 is applied, or if it is because the parameter has been changed by the user then sub-trip 3 is applied. During the stator resistance section of auto-tuning an additional test is performed to measure the drive inverter characteristics to provide the compensation necessary for dead-times. If the inverter characteristic measurement fails then sub-trip 2 is applied.</p> <p>The reason for the trip can be identified by the sub-trip number.</p> <table border="1"> <thead> <tr> <th>Sub-trip</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Stator resistance (5.017) test failed during Autotune or measured stator resistance value is out of range.</td> </tr> <tr> <td>1</td> <td>Reserved</td> </tr> <tr> <td>2</td> <td>Transient inductance (5.024) test failed during Autotune or measured stator resistance value is out of range.</td> </tr> <tr> <td>3</td> <td>The value of Stator Resistance (05.017) is too large when the parameter is edited.</td> </tr> <tr> <td>4</td> <td>Stator resistance (5.017) test successful during Autotune but Pr <b>05.017</b> is too large for this drive current and voltage rating.</td> </tr> </tbody> </table> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Check that a value has not been entered in the stator resistance for the presently selected motor map that exceeds the allowed range.</li> <li>• Check the motor cable / connections</li> <li>• Check the integrity of the motor stator winding using a insulation tester</li> <li>• Check the motor phase to phase resistance at the drive terminals</li> <li>• Check the motor phase to phase resistance at the motor terminals</li> <li>• Ensure the stator resistance of the motor falls within the range of the drive model</li> <li>• Select fixed boost mode (Pr <b>05.014</b> = Fd) and verify the output current waveforms with an oscilloscope</li> <li>• Replace the motor</li> </ul>	Sub-trip	Reason	0	Stator resistance (5.017) test failed during Autotune or measured stator resistance value is out of range.	1	Reserved	2	Transient inductance (5.024) test failed during Autotune or measured stator resistance value is out of range.	3	The value of Stator Resistance (05.017) is too large when the parameter is edited.	4	Stator resistance (5.017) test successful during Autotune but Pr <b>05.017</b> is too large for this drive current and voltage rating.
	Sub-trip	Reason											
	0	Stator resistance (5.017) test failed during Autotune or measured stator resistance value is out of range.											
	1	Reserved											
	2	Transient inductance (5.024) test failed during Autotune or measured stator resistance value is out of range.											
	3	The value of Stator Resistance (05.017) is too large when the parameter is edited.											
4	Stator resistance (5.017) test successful during Autotune but Pr <b>05.017</b> is too large for this drive current and voltage rating.												
<b>So.St</b>	<b>Soft start relay failed to close, soft start monitor failed</b>												
226	<p>The So.St trip indicates that the soft start relay in the drive failed to close or the soft start monitoring circuit has failed. The cause of the trip can be identified by the sub-trip number.</p> <table border="1"> <thead> <tr> <th>Sub-trip</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Soft-start failure</td> </tr> <tr> <td>2</td> <td>DC bus capacitor failure on 110 V drive</td> </tr> </tbody> </table> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Hardware fault – Contact the supplier of the drive</li> </ul>	Sub-trip	Reason	1	Soft-start failure	2	DC bus capacitor failure on 110 V drive						
	Sub-trip	Reason											
1	Soft-start failure												
2	DC bus capacitor failure on 110 V drive												
<b>St.HF</b>	<b>Hardware trip has occurred during last power down</b>												
221	<p>The St.HF trip indicates that a hardware trip (HF01 –HF18) has occurred and the drive has been power cycled. The sub-trip number identifies the HF trip.</p> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Enter 1299 in Pr <b>mm.000</b> and press reset to clear the trip</li> </ul>												
<b>Sto</b>	<b>No Safe Torque Off board fitted</b>												
234	Internal STO board not fitted correctly												
	<p><b>Recommended actions:</b></p> <p>Hardware fault – Contact the supplier of the drive</p>												
<b>th.br</b>	<b>Brake resistor over temperature</b>												
10	<p>The th.br trip is initiated if the hardware based braking resistor thermal monitoring is connected and the resistor overheats. If the braking resistor is not used, then this trip must be disabled with bit 3 of Action <i>On Trip Detection</i> (10.037) to prevent this trip.</p> <p><b>Recommended actions:</b></p> <ul style="list-style-type: none"> <li>• Check brake resistor wiring</li> <li>• Check braking resistor value is greater than or equal to the minimum resistance value</li> <li>• Check braking resistor insulation</li> </ul>												

Trip	Diagnosis								
<b>tH.Fb</b>	<b>Internal thermistor has failed</b>								
218	The <i>tH.Fb</i> trip indicates that an internal thermistor has failed in the drive (i.e. open circuit or short circuit). The thermistor location can be identified by the sub-trip number.								
	<table border="1"> <thead> <tr> <th>Source</th> <th>xx</th> <th>y</th> <th>zz</th> </tr> </thead> <tbody> <tr> <td>Power system</td> <td>01</td> <td>0</td> <td>Thermistor location defined by zz</td> </tr> </tbody> </table>	Source	xx	y	zz	Power system	01	0	Thermistor location defined by zz
	Source	xx	y	zz					
Power system	01	0	Thermistor location defined by zz						
<b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Hardware fault – Contact the supplier of the drive</li> </ul>									
<b>tun.S</b>	<b>Autotune test stopped before completion</b>								
18	The drive was prevented from completing an autotune test, because either the drive enable or the drive run were removed.								
	<b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Check the drive enable signal (Terminal 11) was active during the autotune</li> <li>Check the run command was active in digital input 3 or 4 state (Pr <b>08.003</b> or Pr <b>08.004</b>) during the autotune.</li> </ul>								
<b>tun.1</b>	<b>Required speed could not be reached</b>								
11	The drive has tripped during an autotune. The cause of the trip can be identified from the sub-trip number.								
	<table border="1"> <thead> <tr> <th>Sub-trip</th> <th>Reason</th> </tr> </thead> <tbody> <tr> <td>2</td> <td>The motor did not reach the required speed during rotating autotune.</td> </tr> </tbody> </table>	Sub-trip	Reason	2	The motor did not reach the required speed during rotating autotune.				
	Sub-trip	Reason							
2	The motor did not reach the required speed during rotating autotune.								
<b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Ensure the motor is free to turn i.e. mechanical brake is released</li> </ul>									
<b>U.OI</b>	<b>User OI ac</b>								
8	The U.OI trip is initiated if the output current of the drive exceeds the trip level set by <i>User Over Current Trip Level</i> (04.041).								
<b>U.S</b>	<b>User Save error / not completed</b>								
36	The <i>U.S</i> trip indicates that an error has been detected in the user save parameters saved in non-volatile memory. For example, following a user save command, If the power to the drive was removed when the user parameters were being saved.								
	<b>Recommended actions:</b> <ul style="list-style-type: none"> <li>Perform a user save in Pr <b>mm.000</b> to ensure that the trip doesn't occur the next time the drive is powered up.</li> <li>Ensure that the drive has enough time to complete the save before removing the power to the drive.</li> </ul>								

The trips can be grouped into the following categories. It should be noted that a trip can only occur when the drive is not tripped or is already tripped but with a trip with a lower priority number.

**Table 11-3 Trip categories**

Priority	Category	Trips	Comments
1	Internal faults	HFxx	These indicate internal problems and cannot be reset. All drive features are inactive after any of these trips occur.
1	Stored HF trip	{St.HF}	This trip cannot be cleared unless 1299 is entered into <i>Parameter (mm.000)</i> and a reset is initiated.
2	Non-resettable trips	Trip numbers 218 to 247	These trips cannot be reset.
3	Volatile memory failure	{EEF}	This can only be reset if Parameter <b>mm.000</b> is set to 1233 or 1244, or if <i>Load Defaults</i> (11.043) is set to a non-zero value.
4	NV Media Card trips	Trip numbers 174, 175 and 177 to 188	These trips are priority 5 during power-up.
4	Internal 24V	{PSU}	
5	Trips with extended reset times	{OI.AC}, {OI.br}, and FAn.F.	These trips cannot be reset until 10 s after the trip was initiated.
5	Phase loss and d.c. jumper power circuit protection	{PH.Lo} and {Oh.dc}	The drive will attempt to stop the motor before tripping if a {PH.Lo} trip occurs unless this feature has been disabled (see <i>Action On Trip Detection</i> (10.037)). The drive will always attempt to stop the motor before tripping if an {Oh.dc} occurs.
5	Standard trips	All other trips	

## 11.5 Internal / Hardware trips

Trips {HF01} to {HF23} are internal faults that do not have trip numbers except HF08, HF11, HF12 and HF18. If one of these trips occurs, the main drive processor has detected an irrecoverable error. All drive functions are stopped and the trip message will be displayed on the drive keypad. If a non permanent trip occurs this may be reset by power cycling the drive. On power up after it has been power cycled the drive will trip on St.HF (the sub-trip number indicates the HF fault code). Enter 1299 in **mm.000** to clear the Stored HF trip.

## 11.6 Alarm indications

In any mode, an alarm is an indication given on the display by alternating the alarm string with the drive status string display. If an action is not taken to eliminate any alarm except "tuning", "LS" and "24.LoSt" the drive may eventually trip. Alarms are not displayed when a parameter is being edited.

Table 11-4 Alarm indications

Alarm string	Description
<b>br.res</b>	Brake resistor overload. <i>Braking Resistor Thermal Accumulator</i> (10.039) in the drive has reached 75.0 % of the value at which the drive will trip.
<b>OV.Ld</b>	<i>Motor Protection Accumulator</i> (04.019) in the drive has reached 75.0 % of the value at which the drive will trip and the load on the drive is >100 %.
<b>d.OV.Ld</b>	Drive over temperature. <i>Percentage Of Drive Thermal Trip Level</i> (07.036) in the drive is greater than 90 %.
<b>tuning</b>	The autotune procedure has been initialized and an autotune in progress.
<b>LS</b>	Limit switch active. Indicates that a limit switch is active and that is causing the motor to be stopped.
<b>Lo.AC</b>	Low voltage mode. See <i>Low AC Alarm</i> (10.107).
<b>I.AC.Lt</b>	Current limit active. See <i>Current Limit Active</i> (10.009).
<b>24.LoSt</b>	24V backup not present. See <i>24V Alarm Loss Enable</i> (11.098).

## 11.7 Status indications

Table 11-5 Status indications

String	Description	Drive output stage
<b>inh</b>	The drive is inhibited and cannot be run. Either the drive enable signal is not applied to the drive enable terminals or Pr <b>06.015</b> is set to 0.	Disabled
<b>rdy</b>	The drive is ready to run. The drive enable is active, but the drive inverter is not active because the final drive run is not active.	Disabled
<b>Stop</b>	The drive is stopped / holding zero speed.	Enabled
<b>S.Loss</b>	Supply loss condition has been detected.	Enabled
<b>dc.inj</b>	The drive is applying dc injection braking.	Enabled
<b>Er</b>	The drive has tripped and no longer controlling the motor. The trip code appears in the display.	Disabled
<b>UV</b>	The drive is in the under voltage state either in low voltage or high voltage mode.	Disabled
<b>HEAt</b>	The motor pre-heat function is active.	Enabled

Table 11-6 Status indications at power-up

String	Status
<b>PS.LOAD</b>	Waiting for power stage
The drive is waiting for the processor in the power stage to respond after power-up	

## 11.8 Displaying the trip history

The drive retains a log of the last ten trips that have occurred. *Trip 0* (10.020) to *Trip 9* (10.029) store the most recent 10 trips that have occurred where *Trip 0* (10.020) is the most recent and *Trip 9* (10.029) is the oldest. When a new trip occurs it is written to *Trip 0* (10.020) and all the other trips move down the log, with oldest being lost. The date and time when each trip occurs are also stored in the date and time log, i.e. *Trip 0 Date* (10.041) to *Trip 9 Time* (10.060). The date and time are taken from *Date* (06.016) and *Time* (06.017). Some trips have sub-trip numbers which give more detail about the reason for the trip. If a trip has a sub-trip number its value is stored in the sub-trip log, i.e. *Trip 0 Sub-trip Number* (10.070) to *Trip 9 Sub-trip Number* (10.079). If the trip does not have a sub-trip number then zero is stored in the sub-trip log.

## 11.9 Behavior of the drive when tripped

If the drive trips, the output of the drive is disabled so the load coasts to a stop. If any trip occurs, the following read only parameters are frozen until the trip is cleared. This is to help diagnose the cause of the trip.

Parameter	Description
<b>01.001</b>	Frequency reference
<b>01.002</b>	Pre-skip filter reference
<b>01.003</b>	Pre-ramp reference
<b>01.069</b>	Reference in rpm
<b>01.070</b>	Clamped reference
<b>02.001</b>	Post-ramp reference
<b>03.001</b>	Final demand ref
<b>04.001</b>	Current magnitude
<b>04.002</b>	Active current
<b>04.017</b>	Reactive current
<b>05.001</b>	Output frequency
<b>05.002</b>	Output voltage
<b>05.003</b>	Power
<b>05.005</b>	DC bus voltage
<b>07.001</b>	Analog input 1

If the parameters are not required to be frozen then this can be disabled by setting bit 4 of Pr **10.037**.

## 12 UL Listing

### 12.1 UL file reference

All products covered by this Guide are UL Listed to both Canadian and US requirements. The UL file reference is: NMMS/7.E171230.

### 12.2 Option modules, kits and accessories

All Option Modules, Control Pods and Installation Kits supplied by Emerson Industrial Automation for use with these drives are UL Listed.

### 12.3 Enclosure ratings

Drives are UL Open Type as supplied.

Drives fitted with a conduit box are UL Type 1.

### 12.4 Mounting

Drives can be mounted directly onto a vertical surface. This is known as 'surface' or 'standard' mounting. Refer to relevant Power Installation Guide for further information.

Drives can be installed side by side with recommended spacing between them. This is known as 'bookcase' mounting. Refer to relevant Power Installation Guide for further information.

Drives fitted with a conduit box can be mounted directly onto a wall or other vertical surface without additional protection. Suitable conduit boxes are available from Emerson Industrial Automation.

### 12.5 Environment

Drives must be installed in a Pollution Degree 2 environment or better (dry, non-conductive pollution only).

All drives are capable of delivering full rated output current at surrounding air temperatures up to 40 °C.

Drives may be operated in surrounding air temperatures up to 50 °C or 55 °C at de-rated current, depending on the model number. Refer to relevant Power Installation Guide for further information.

### 12.6 Electrical Installation

#### TERMINAL TORQUE

Terminals must be tightened to the rated torque as specified in the Installation Instructions. Refer to relevant Power Installation Guide for further information.

#### WIRING TERMINALS

Drives must be installed using cables rated for 75 °C operation, copper wire only.

UL Listed closed-loop connectors sized according to the field wiring shall be used for all field wiring connections. Refer to relevant Power Installation Guide for further information.

#### BRANCH CIRCUIT PROTECTION

The fuses and circuit breakers required for branch circuit protection are contained in the Installation Instructions. Refer to relevant Power Installation Guide for further information.

#### OPENING OF BRANCH CIRCUIT

Opening of the branch-circuit protective device may be an indication that a fault has been interrupted. To reduce the risk of fire or electric shock, the equipment should be examined and replaced if damaged. If burnout of the current element of an overload relay occurs, the complete overload relay must be replaced.

Integral solid state short circuit protection does not provide branch circuit protection. Branch circuit protection must be provided in accordance with the National Electrical Code and any additional local "codes".

#### DYNAMIC BRAKING

Drives with model numbers beginning M100, M101, M200, M201, M300 or M400 have been evaluated for dynamic braking applications.

### 12.7 Motor overload protection and thermal memory retention

All drives incorporate internal overload protection for the motor load that does not require the use of an external or remote overload protection device.

The protection level is adjustable and the method of adjustment is provided in section 8.4 *Motor thermal protection* on page 38. Maximum current overload is dependent on the values entered into the current limit parameters (motoring current limit, regenerative current limit and symmetrical current limit entered as percentage) and the motor rated current parameter (entered in amperes).

The duration of the overload is dependent on motor thermal time constant. The time constant is programmable. The default overload protection is typically set to 150 % of the motor rated current for 120 seconds.

The method of adjustment of the overload protection is provided in the Installation Instructions shipped with the product.

All models are provided with thermal memory retention.

### 12.8 Electrical supply

The drives are suitable for use on a circuit capable of delivering not more than 10,000 RMS Symmetrical Amperes, at rated voltage when protected by circuit breakers as specified in the Installation Instructions.

### 12.9 External Class 2 supply

The external power supply used to power the 24 V control circuit shall be marked: "UL Class 2". The power supply voltage shall not exceed 24 Vdc.

### 12.10 Group Installation and Modular Drive Systems

Drives with DC+ and DC- supply connections, with 230 V or 480 V supply voltage rating, are UL approved for use in modular drive systems as inverters when supplied by the converter sections: Mentor MP25A, 45A, 75A, 105A, 155A or 210A range manufactured by Emerson Industrial Automation.

Alternatively, the inverters may be supplied by converters from the Unidrive-M range manufactured by Emerson Industrial Automation.

In these applications the inverters are required to be additionally protected by supplemental fuses.

Drives have not been evaluated for other Group Installation applications, for example where a single inverter is wired directly to two or more motors. In these applications, additional thermal overload protection is needed. Contact Emerson Industrial Automation for further details.
